## RESEARCH BACKGROUND

40 % of stream runoff is coming from snow and glacier melt in the Rhone valley  
[ Huss et al. 2009]

In Switzerland, 84 out of 85 glaciers under observation became shorter  
[WGMS, 2008]

55 % of Swiss energy from Hydropower.  
[Schleiss et al. 2007]

Alarming negative mass balance trend observed in the Rhone Glacier  
[Funk et al 2008]

## RESEARCH QUESTIONS

How well hydrological models (SWAT-RS 3.0) are capable simulating runoff in Upper Rhone River

Taking into account

- Glacier
- Orographic Precipitation
- Snow melt

Long term forecast for water status for glacier dominated Upper Rhone watershed

Taking into account

- Climate change scenarios( IPCC, Ensemble/Prudence)
- Energy driven scenarios
- Land use scenarios ( EnviroGRID)

Process	SWAT	RS 3.0
Surface runoff	(i) <b>Curve Number (CN)</b> (ii) Green and Ampt approach	Kinemtic wave over a inclined plan (SWMM)
Evapotranspiration	(i) Priestley-Taylor (ii) <b>Penman-Monteith</b> (iii) Hargreaves	Turc method
Flow routing	(i) Variable storage coefficient (ii) Muskingum approach	Kinematic wave St-Venant dynamic wave
Snow melt	Temperature Index <b>Temperature Index with Elevation</b> Energy budget based SNOW 17	Enhanced Temperature Index with 2 reservoirs
Glacier Melt	?	Enhanced Temperature Index

# FIRST IMPROVEMENT

- Introduction
- Study area
- Methodology
- Results
- Discussion
- Conclusion
- Acknowledgement

(Huss, et al., 2009)

Time lag of rising limb no longer exists  
Summer overestimation, Winter underestimation  
Secondary peaks

# HYDROGRAPH SEPARATION

Introduction

Study area

**Methodology**

Results

Discussion

Conclusion

Acknowledgement

- Tracers are conservative (no chemical reactions);
- All components have significantly different concentrations for at least one tracer;
- Tracer concentrations in all components are temporally constant or their variations are known;
- Tracer concentrations in all components are spatially constant or treated as different components;

## Two End Member Mixing Model

$$Q_g = Q_b + Q_y$$

$$Q_g C_g = Q_b C_b + Q_y C_y$$

$$Q_b = Q_g - Q_y$$

$$= Q_g \frac{C_g - C_y}{C_b - C_y}$$

Liu et al. (2008)

# HYDROGRAPH SEPARATION

3 component mixing model

- Two Conservative Tracers

Simultaneous Equations

$$f_1 + f_2 + f_3 = 1$$

$$C_1^1 f_1 + C_2^1 f_2 + C_3^1 f_3 = C_t^1$$

$$C_1^2 f_1 + C_2^2 f_2 + C_3^2 f_3 = C_t^2$$

Solutions

$$f_1 = \frac{(C_t^1 - C_3^1)(C_2^2 - C_3^2) - (C_2^1 - C_3^1)(C_t^2 - C_3^2)}{(C_1^1 - C_3^1)(C_2^2 - C_3^2) - (C_2^1 - C_3^1)(C_1^2 - C_3^2)}$$

$$f_2 = \frac{C_t^1 - C_3^1}{C_2^1 - C_3^1} - \frac{C_1^1 - C_3^1}{C_2^1 - C_3^1} f_1$$

$$f_3 = 1 - f_1 - f_2$$

f - Discharge Fraction

C - Tracer Concentration

## PERFORMANCE EVALUATION

Moriasi, D.N. et al., 2007. Model evaluation guidelines for systematic quantification of accuracy in watershed simulations. Transactions of the Asabe, 50(3): 885-900.

[NSE > 0.5, RSR ≤ 0.70, PBIAS = ± 25% ]

Criteria	Equation	SWAT	RS 3.0
NSE	$NSE = 1 - \left[ \frac{\sum_{i=1}^n (X_i^{obs} - X_i^{sim})^2}{\sum_{i=1}^n (X_i^{obs} - X_i^{mean})^2} \right]$	77	93
PBIAS	$PBIAS = \left[ \frac{\sum_{i=1}^n (X_i^{obs} - X_i^{sim}) \times 100}{\sum_{i=0}^n (X_i^{obs})} \right]$	5.43	5.26
RSR	$SR = \frac{RMSE}{STDEV_{obs}} = \left[ \frac{\sqrt{\sum_{i=1}^n (X_i^{obs} - X_i^{sim})^2}}{\sqrt{\sum_{i=1}^n (X_i^{obs} - X_i^{mean})^2}} \right]$	0.46	0.41

Where  $X_i^{obs}$  = observed variable (flow in  $m^3s^{-1}$ )

$X_i^{sim}$  is the simulated variable (flow in  $m^3s^{-1}$ )

$X_i^{mean}$  is the mean of n values and n is the number of observations

## RESEARCH FINDINGS

Introduction

Study area

Methodology

Results

Discussion

**Conclusion**

Acknowledgement

### Key Findings..

- Model generated runoff has close match with measured runoff  
[NSE varies between 77 (daily) to 84 (monthly)]
- Glacier can be treated as reservoir and the outflow can be routed through reservoir
- Application of Elevation band has significant impact on snow/glacier melt process  
[Efficiency varies based on number of elevation band selection]
- Sensitive parameters are mostly related to snow/glacier melt process  
[SMTMP, SMFMN SMFMX..]

## NEXT STEPS...

Introduction

Study area

Methodology

Results

Discussion

**Conclusion**

Acknowledgement

Extend the calibration for entire Rhone

Link with species community

Sub daily calibration ( Hydropower optimization )

Climate change scenario implementation( Prudence )

Land use change scenario implementation( enviroGRIDS)

## QUESTIONS & ANSWERS..

Introduction

Study area

Methodology

Results

Discussion

**Conclusion**

Acknowledgement

1. was there any point source? if so what were they? how did you get the point source data? was it daily or monthly?
2. what were the final calibration parameter? I see the sensitivity list?
3. was it using auto calibration? if so what are the uncertainty?
4. how does rock parameters help in final calibration..
5. how was the glacier area was estimated?
6. did you implement elevation bands? also permanent snow depths?

hope some of these questions help to make your presentation better.

## LIMITATIONS

Introduction

Study area

Methodology

Results

Discussion

**Conclusion**

Acknowledgement

1. Availability of spatial extents and thickness
2. Hydrograph separation for one melt season
3. Expensive equipment's
