

# **A quick glance at SWAT modular codes**

---

**2015 SWAT Conference**

Pula/Sardinia/Italy

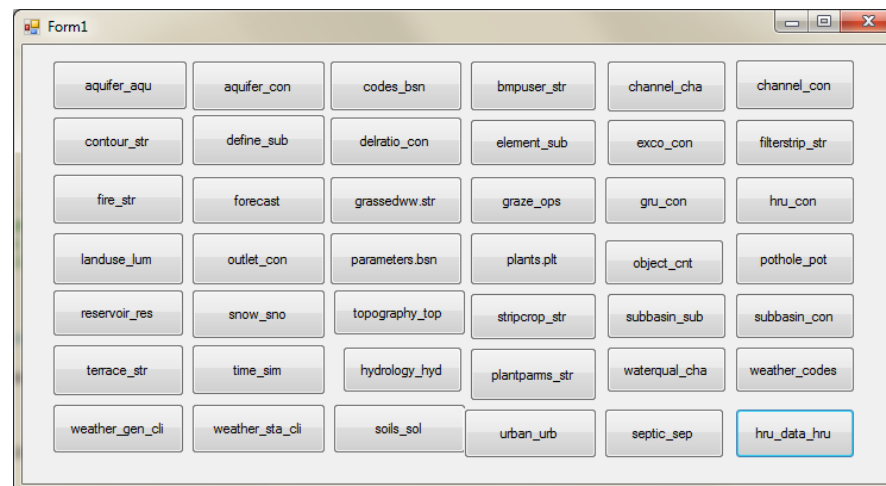

18 June 2015

**Jeong, J. & Her, Y.**

# Input Data Formats

- Object type based
  - Rather than subbasin & HRU based
  - No. input files remain the same regardless of No. subbasins & HRUs
    - Easy to handle input files
    - Efficient for large & fine-scale modeling & calibration
      - 137 Subbasins & 1212 HRUs (Brentwood watershed)
      - 40 files (modular) vs. 9400 files (rev. 629)
- Can we still use input files in the old formats?

Fig.1. Converter from old input file formats to the new ones  
(Developed by Dr. White)

From  
“ProjectName.dbf”  
to a set of input  
files in the new  
format

# Input Data Formats

- How relationships between objects are defined?

Fig.1. Example of input data format ('subbasin.con')

subbasin.con - Brentwood Watershed													
1	subbasin.con - Brentwood Watershed												
3	Subbasin No.	137											
4	NUMB	NAME	PROPS	SRC_TOT	OBTYP_OUT	OBTYPNO_OUT	HTYP_OUT	FRAC_OUT	OBTYP_OUT	OBTYPNO_OUT	HTYP_OUT	FRAC_OUT	
5	1	sub001	1	2	cha	1	tot	1.0	agu	1	rhg	1.0	
6	2	sub002	2	2	cha	2	tot	1.0	agu	2	rhg	1.0	
7	3	sub003	3	2	cha	3	tot	1.0	agu	3	rhg	1.0	
8	4	sub004	4	2	cha	4	tot	1.0	agu	4	rhg	1.0	
9	5	sub005	5	2	cha	5	tot	1.0	agu	5	rhg	1.0	

Property ID

Total number of outgoing (source) objects

Type & ID of objects to which routed

Outflow hydrograph type & fraction

Type & ID of objects to which routed

Outflow hydrograph type & fraction

For channel (Outgoing object 1)

For aquifer (Outgoing object 2)

Total runoff c.f. aquifer recharge (rhg), surface runoff (surf)

Fig.2. Example of input data format ('channel.con': similar function to that of 'fig.fig')

channel.con - Brentwood Watershed													
Weather Station													
1	channel.con - Brentwood Watershed												
3	Subbasin No.	137											
4	NUMB	NAME	AREA	CH	CHWQ	WST	SRC_TOT	OBTYP_OUT	OBTYPNO_OUT	HTYP_OUT	FRAC_OUT		
5	1	cha001	1.1	1	1	1	1	cha	5	tot	1.0		
6	2	cha002	1.3	2	1	1	1	cha	5	tot	1.0		
7	3	cha003	1.1	3	1	1	1	cha	6	tot	1.0		
8	4	cha004	1.1	4	1	1	1	cha	6	tot	1.0		
9	5	cha005	2.7	5	1	1	1	cha	6	tot	1.0		

Cumulative drainage area (ha)

Channel ID

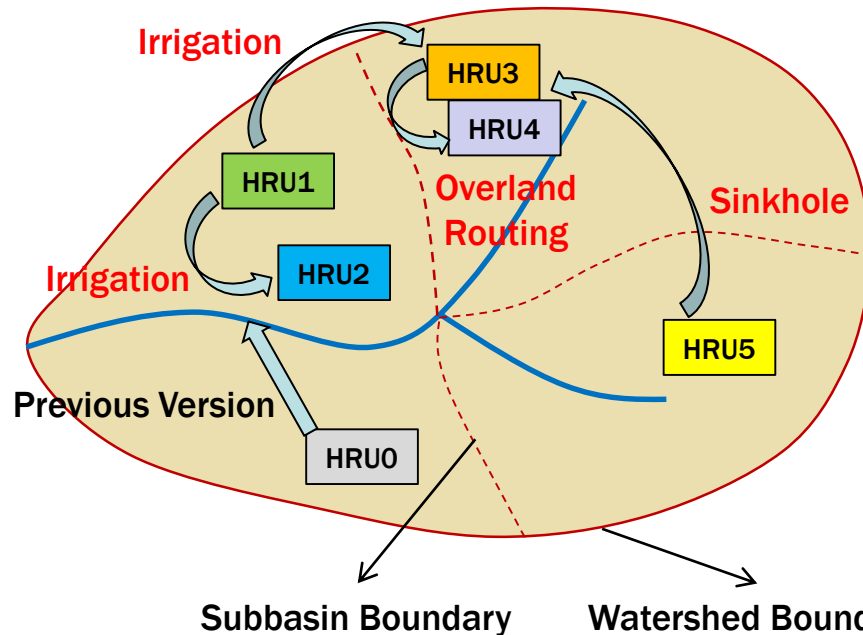

Total number of outgoing (source) objects

ID of outgoing (source) objects

Outflow hydrograph type & fraction

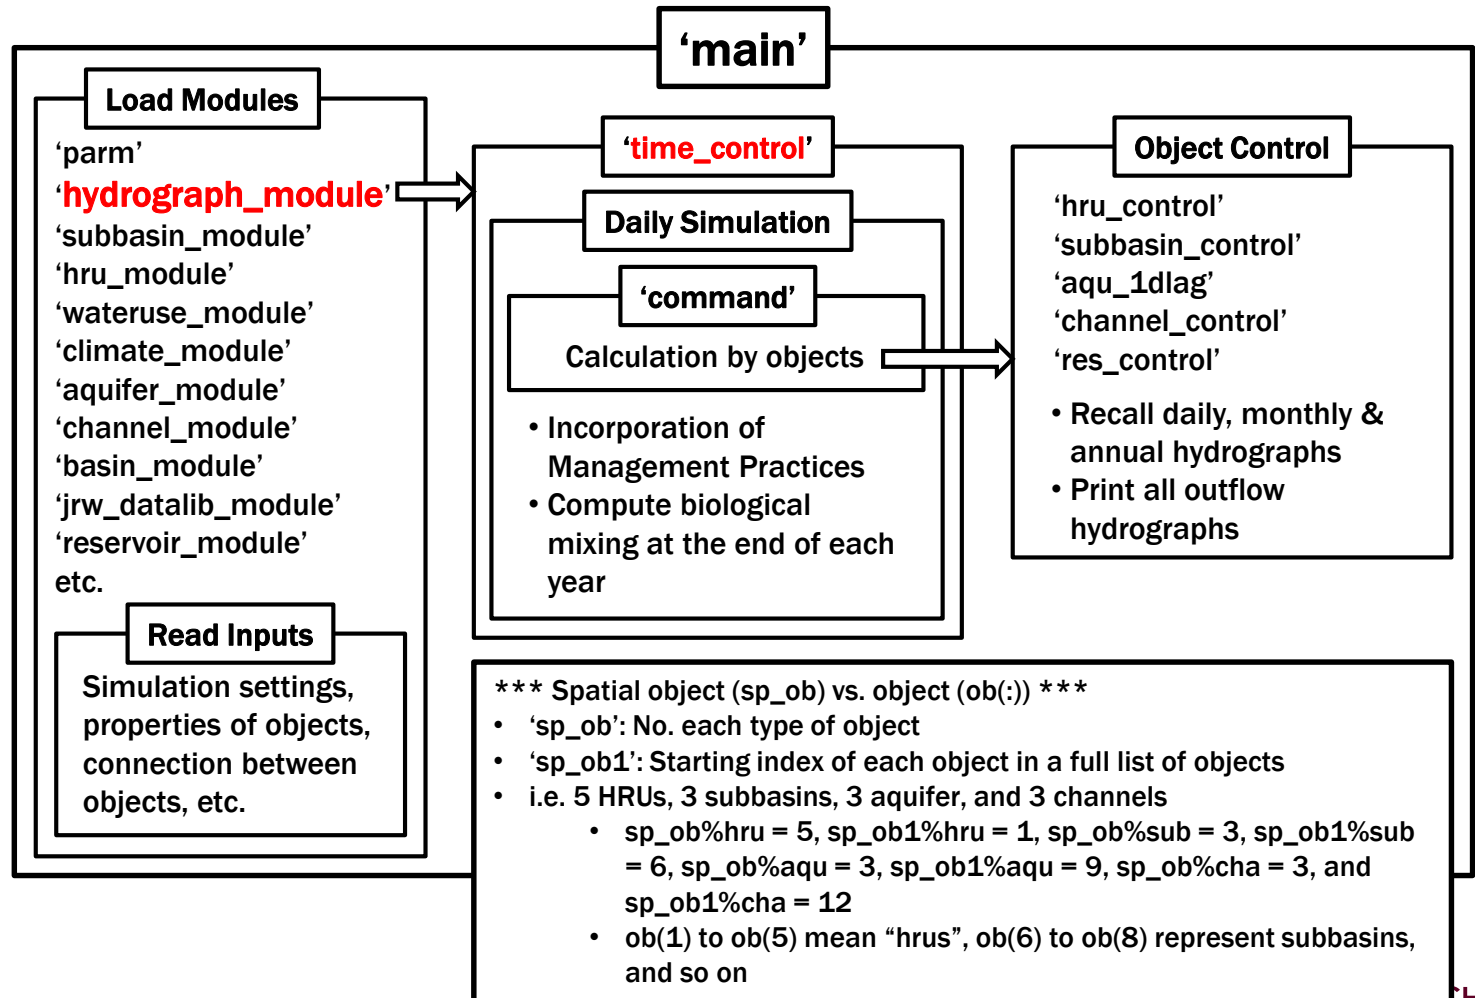

# Model Structure

- Flexible modeling framework
  - HRU to HRU routing is possible
    - Direct runoff generated in a HRU can go any HRU
    - HRU-based overland (landscape) routing
  - Easily add objects & modify connections between objects
    - Point sources, irrigation, Karst, terraced paddy fields, etc.

# Model Structure

- Overall structure

# Model Structure

- Data Type?

```
type object_connectivity
  character(len=16) :: name = "hru_default"
  integer :: typ = 1      !object type - ie hru, hru_lte, sub, chan, res, recall
  integer :: props = 1   !properties number from data base (ie hru.dat, sub.dat)
  integer :: props2     !additional properties number from data base (ie chan wq)
  integer :: wst = 1     !weather station number
  real :: ha = 80.       !area - ha ! need to be changed to read areas from input files
  integer :: fired = 0   !0=not fired; 1=fired off as a command
  integer :: cmd_next = 0 !next command (object) number
  integer :: cmd_prev = 0 !previous command (object) number
  integer :: cmd_order = 0 !1=headwater,2=2nd order,etc
  integer :: src_tot = 0 !total number of outgoing (source) objects
  integer :: rcv_tot = 0 !total number of incoming (receiving) hydrographs
  integer :: rcvob_tot = 0 !total number of incoming (receiving) objects
  integer :: dfn_tot = 0 !total number of defining objects (ie hru's within a subbasin)
  integer :: subs_tot    !number of subbasins that contain this object
  integer :: elem        !subbasins element number for this object
  integer :: flood_ch_ob !channel tha landscape unit is linked to
  character(len=3), dimension(:), allocatable :: obtyp_out    !outflow object type (ie 1=hru, 2=sd_hru, 3=sub, 4=chan, etc)
  integer, dimension(:), allocatable :: obtypno_out           !outflow object type name
  integer, dimension(:), allocatable :: obj_out              !outflow object
  character(len=3), dimension(:), allocatable :: htyp_out     !outflow hyd type (ie 1=tot, 2= recharge, 3=surf, etc)
  integer, dimension(:), allocatable :: ihtyp_out            !outflow hyd type (ie 1=tot, 2= recharge, 3=surf, etc)
  real, dimension(:), allocatable :: frac_out                !fraction of hydrograph
  integer, dimension(:), allocatable :: obtyp_in             !inflow object type (ie 1=hru, 2=sd_hru, 3=sub, 4=chan, etc)
  integer, dimension(:), allocatable :: obtypno_in          !outflow object type number
  integer, dimension(:), allocatable :: obj_in              !inflow object
  integer, dimension(:), allocatable :: htyp_in             !inflow hyd type
  real, dimension(:), allocatable :: frac_in                 !fraction of hydrograph
  type (hyd_output) :: hin                                   !inflow hydrograph for surface runon - sum of all inflow hyds
  type (hyd_output) :: hin_s                                !inflow hydrograph for lateral soil flow - sum of all lateral inflow hyds
  type (hyd_output), dimension(:),allocatable :: hd         !generated hydrograph (ie 1=tot, 2= recharge, 3=surf, etc)
  real, dimension(:), allocatable :: ts                     !time step
  real :: peakrate                                         !peak flow rate during time step - m3/s

  type (hyd_output), dimension(:),allocatable :: hin_m
  type (hyd_output), dimension(:),allocatable :: hin_y
  type (hyd_output), dimension(:),allocatable :: hin_a
  type (hyd_output), dimension(:),allocatable :: hout_m
  type (hyd_output), dimension(:),allocatable :: hout_y
  type (hyd_output), dimension(:),allocatable :: hout_a
  type (hyd_output) :: hdep_m
  type (hyd_output) :: hdep_y
  type (hyd_output) :: hdep_a
  integer, dimension(:), allocatable :: obj_subs           !subbasins object number that contain this object
end type object_connectivity
type (object_connectivity), dimension(:),allocatable, save :: obj
```

**ob(i)%subs\_tot**

- 'i': object index
- 'subs\_tot': a property of ob(i)

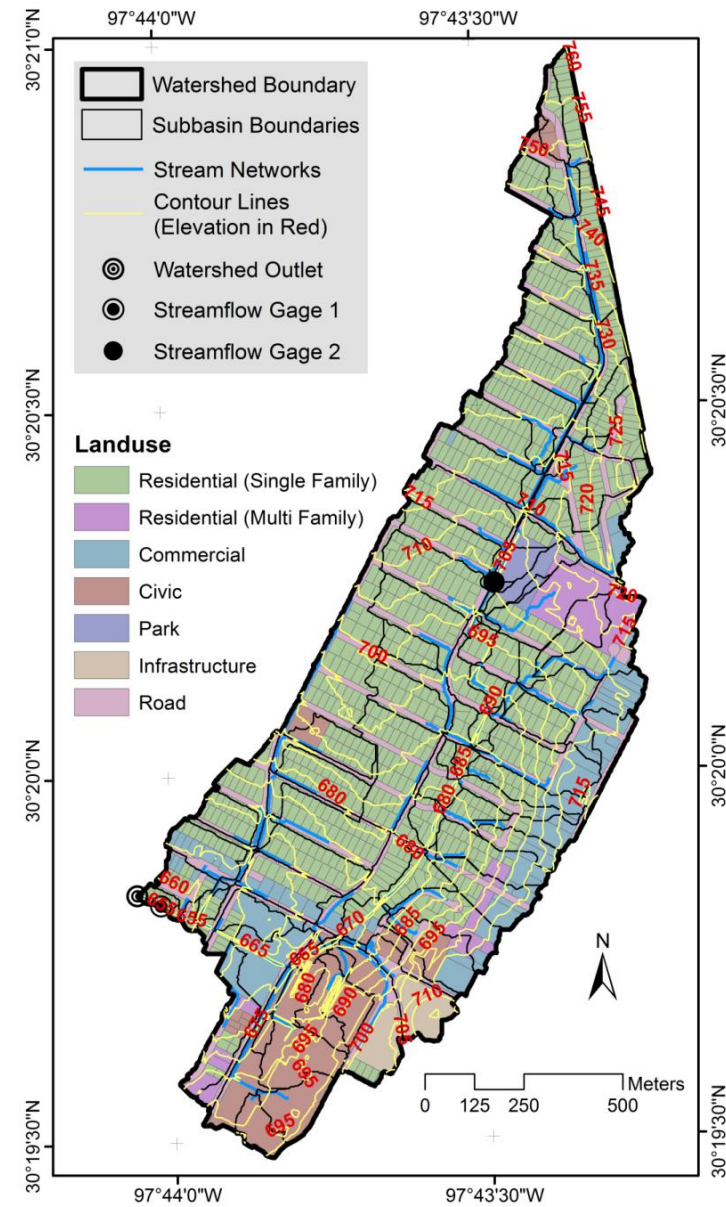

# Challenges

---

- **Runtime Initialization**
  - Over 30 seconds with 137 subbasins & 1212 HRUs
  - Parallel loading?
- **Routing scheme between spatial objects**
  - Hard to track variables of each object
  - User Manual needed for developers
- **Parallelization**
  - HRU and subbasin-level computations are independent
  - Channel routing is inherently hierarchical process
    - But there are some options (P-SWAT, Wu et al., 2012)
    - Wu, Y., Li, T., L., S., & Chen, J. (2013). Parallelization of a hydrological model using the message passing interface. *Environ. Modelling Software*, 43, 124-132.  
<http://dx.doi.org/10.1016/j.envsoft.2013.02.002>.

# SWAT for Brentwood Watershed

- **Brentwood WS**
  - Austin, TX
  - 149.8 ha
  - Highly urbanized
  - Monitored by City of Austin
- **SWAT**
  - Prepared by City of Austin
  - Great details
    - 137 subbasins (1.1 ha/sub)
    - 1212 HRUs (0.12 ha/HRU)
  - Calibrated by BRC

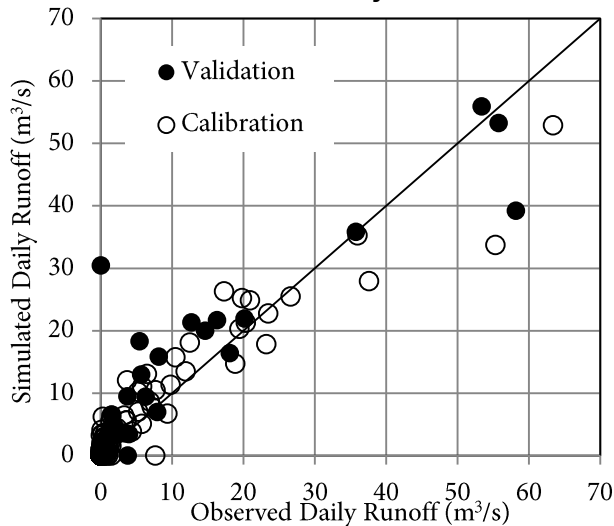

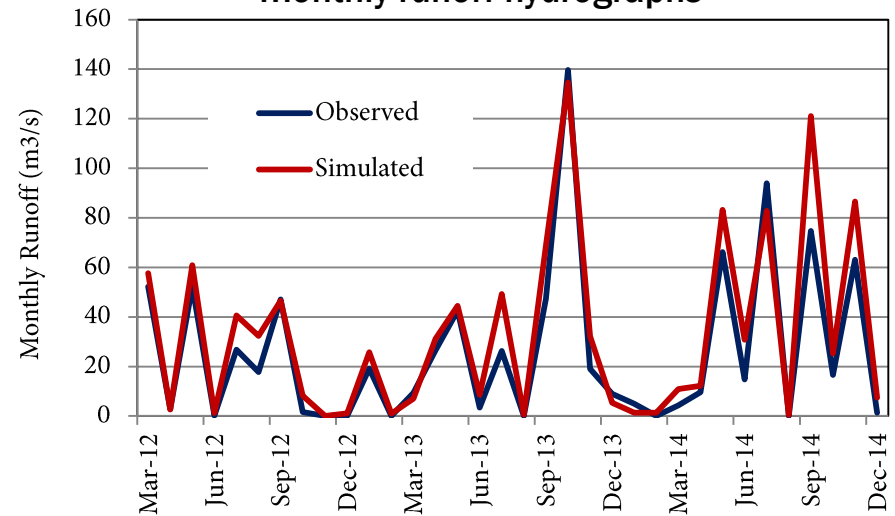

# SWAT for Brentwood Watershed

- **Calibrated SWAT**
  - ‘Good’ performance; overestimated runoff volume

**Fig. 1. Comparison of observed & simulated daily runoff**

**Fig. 2. Comparison of observed & simulated monthly runoff hydrographs**

**Table 1. Performance statistics of the calibrated SWAT model**

Period	NSE			R <sup>2</sup>		
	15-min	Daily	Monthly	15-min	Daily	Monthly
<b>Calibration</b>	0.88	0.91	0.91	0.89	0.91	0.94
<b>Validation</b>	0.71	0.84	0.73	0.71	0.86	0.89
