

Improving Representation of Soil Characteristics and Hydrology Using Topographically Derived Initialization Processes and Data Brokering

Zachary M. Easton¹, Amy Collick², Peter Kleinman²,
Andrew Sommerlot¹, Siri Jodha Kahlsa³, and Daniel Fuka¹

¹Biological Systems Engineering, Virginia Tech; ²USDA-ARS;

³National Snow and Ice Data Center

Outline

- Introduction to Brokering and NSF's BCube
- Topography, Soils, and TopoSWAT
- VSA / Non-Hortonian Case
 - USDA WE-38, PA
- Extending VSA methods to Hortonian
 - Reisel, TX
- What does this imply for SWAT model development

What is Data Brokering?

Science Discipline Interoperability

Two Complementary Approaches

- Standardization
 - Systems Federation
 - A group of people agreeing on a format
 - Controlled and mature environments
- Intermediation (i.e. System Brokering)
 - Complex data types supported
 - Allows rapidly evolving environments

Problems Brokering Fixes

- “Process” based modeling requires many disparate data source with different formats from different locations
- Sources are not necessarily consistent
- With many options, repeatability decreases
- More frequently watershed initialization is a result of derived datasets with source specific transformations and manipulations
- Derived datasets are rarely “Repeatable” from traditional literature methods sections.

Brokering Framework Principles

- A broker connects information resources by **mediating interactions** between those resources **without requiring** the maintainers of those resources to adapt new conventions or install software components
- User likewise need not understand and be able to manipulate all data formats

Soil genesis as explained by Topography!

$$I = \ln \frac{a}{b \tan \theta}$$

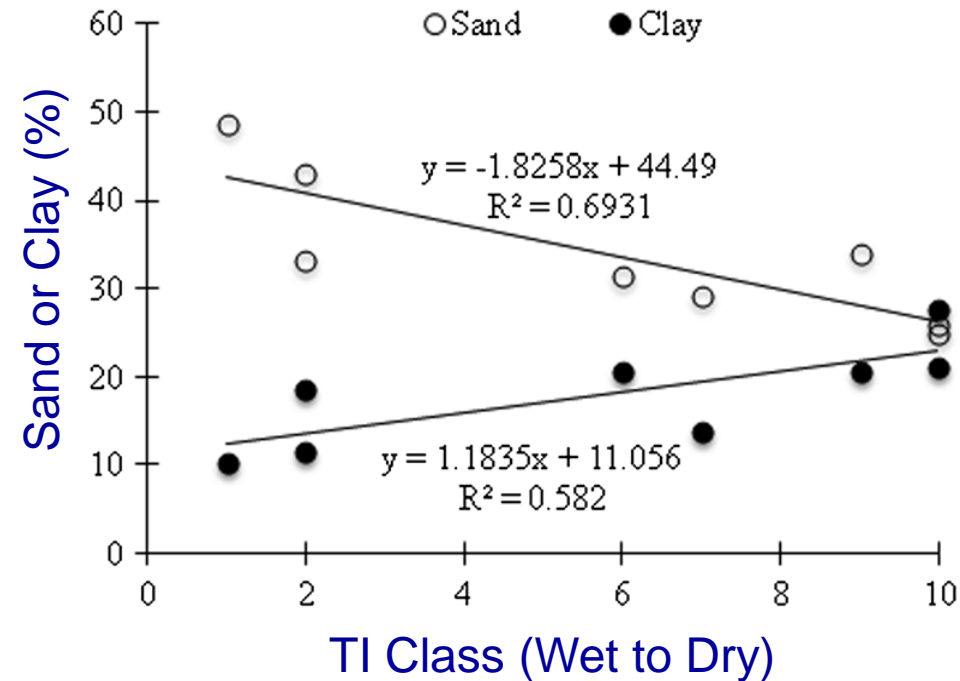

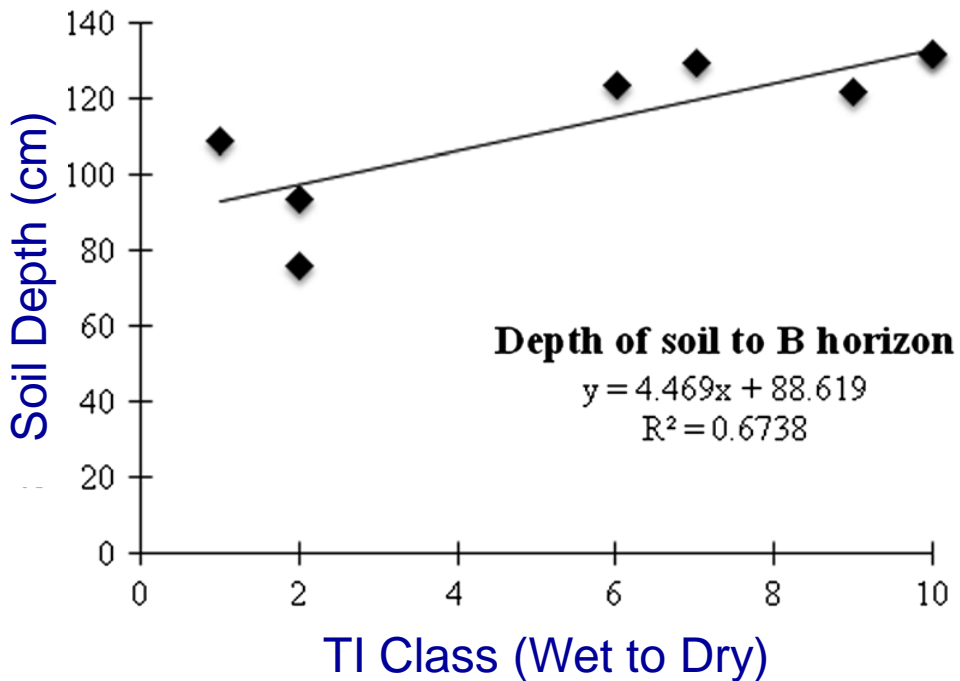

Variable Source Area Hydrology

USDA WE38, PA, USA

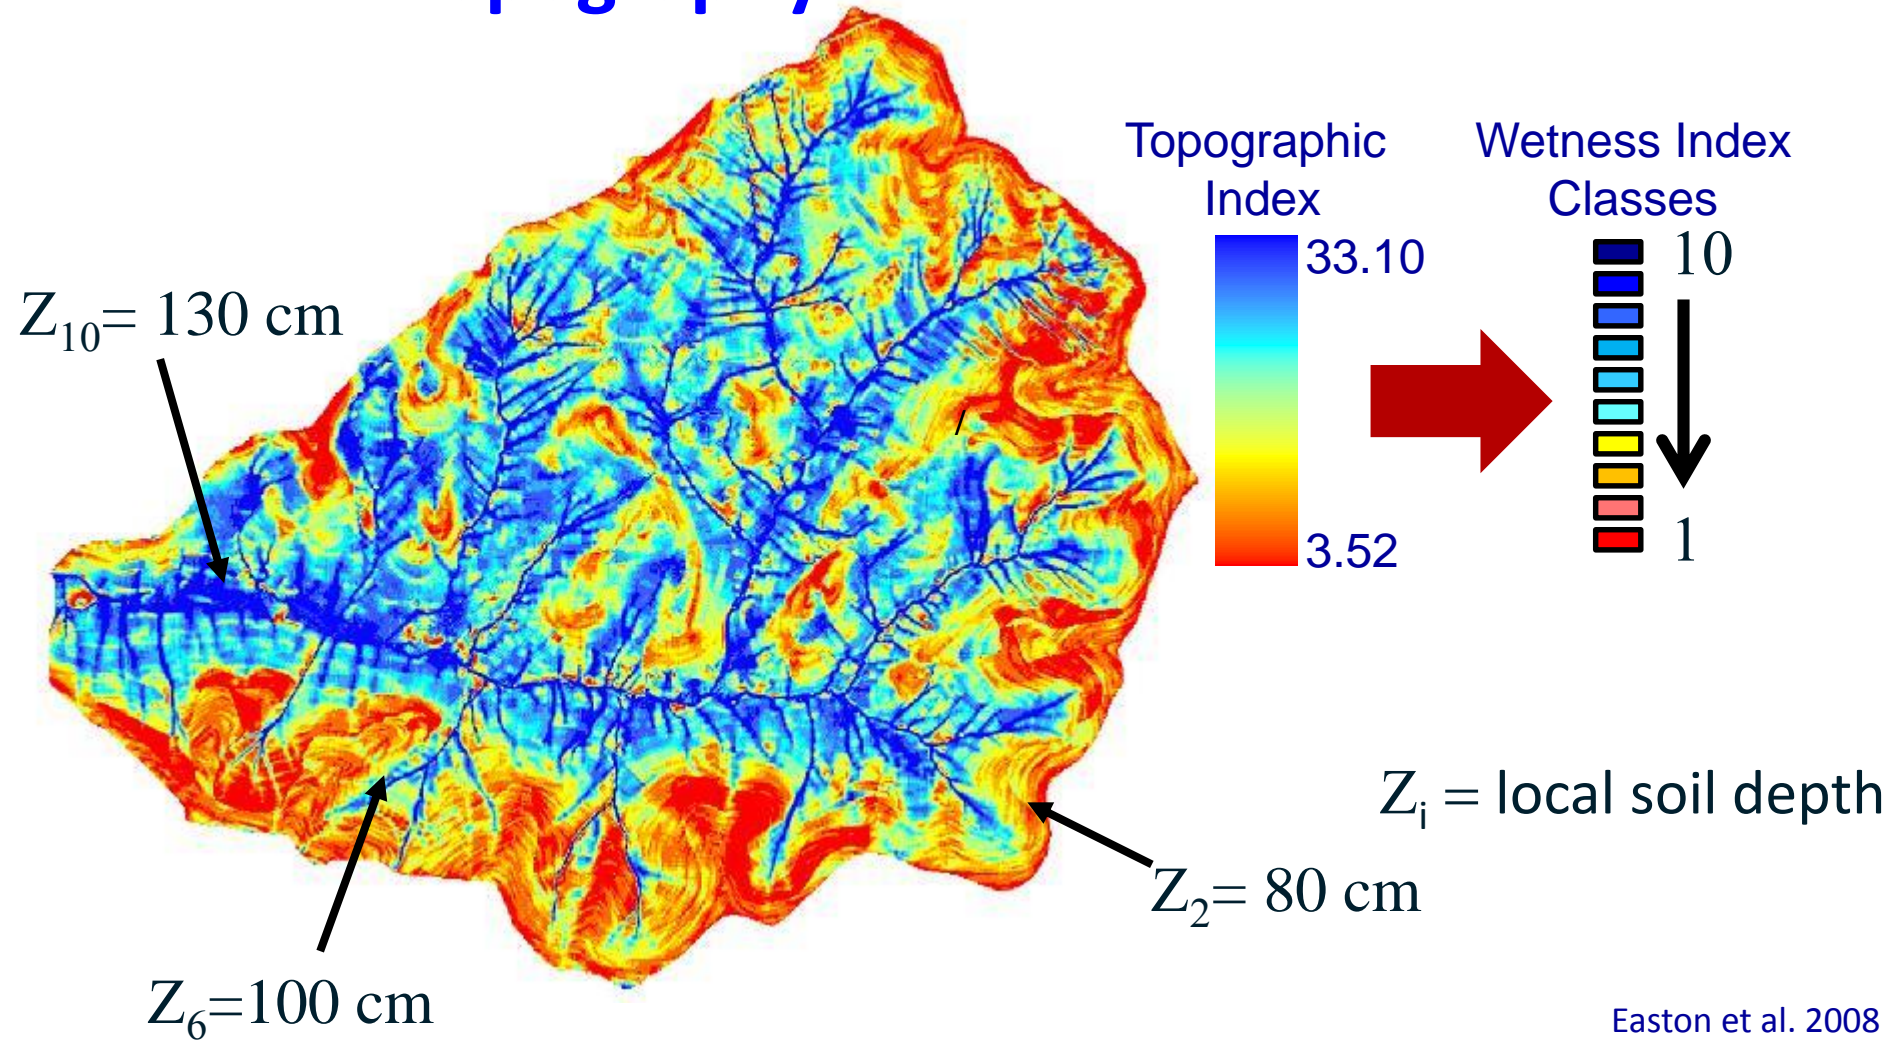

Topography to explain soil depth and fractions

Using measured pedon data from ARS long term watershed

Soil genesis as explained by Topography!

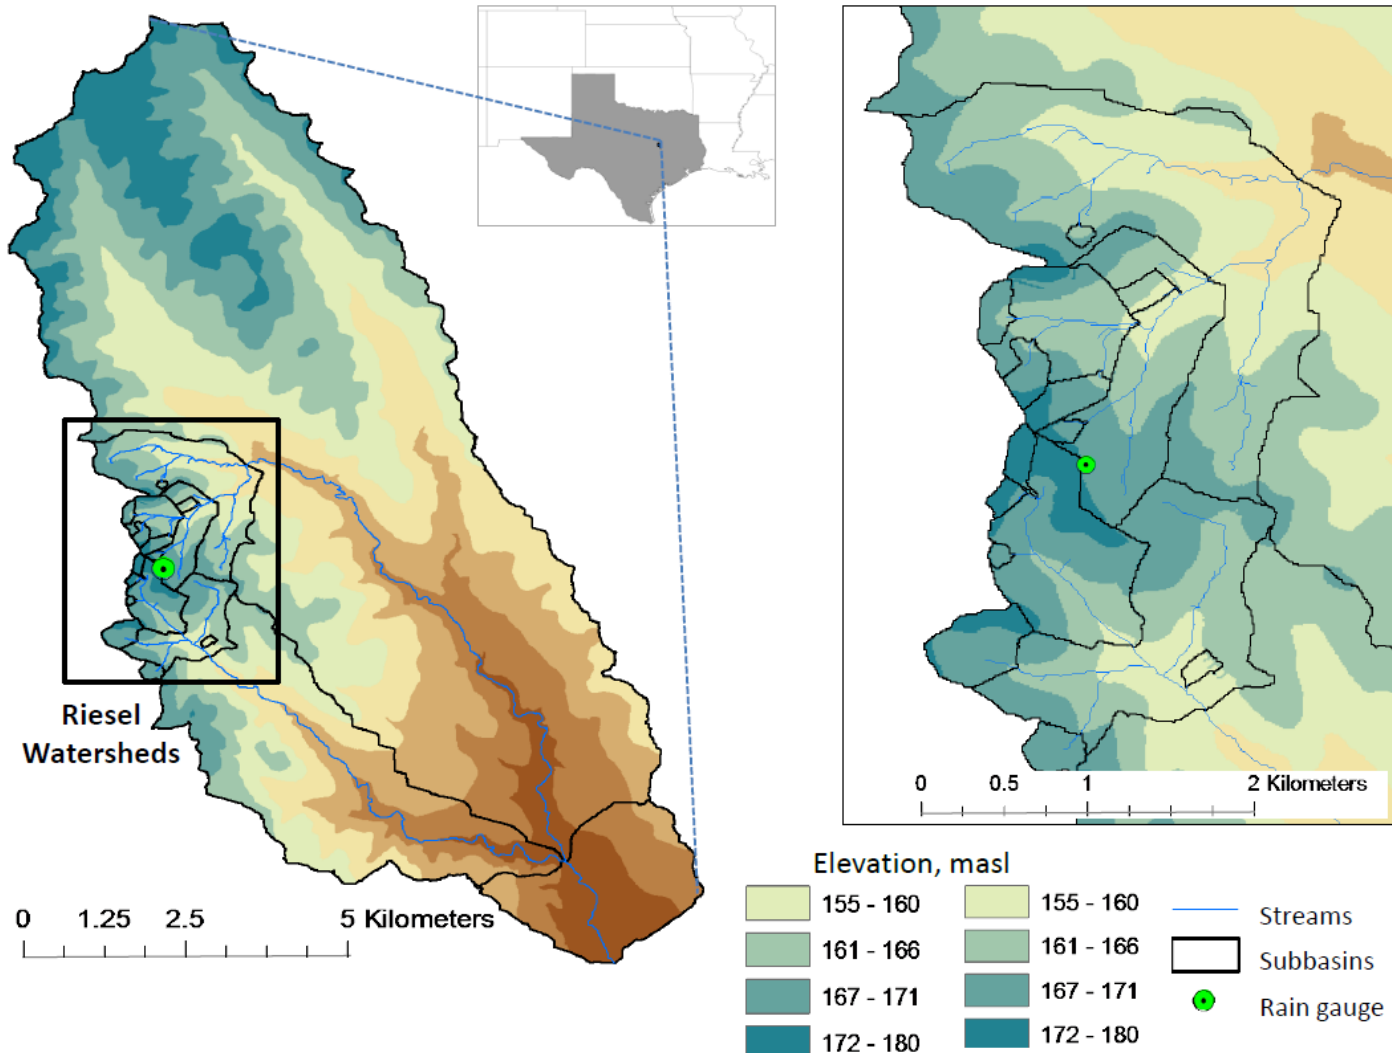

$$I = \ln \left(\frac{a}{b \tan \theta} \right)$$

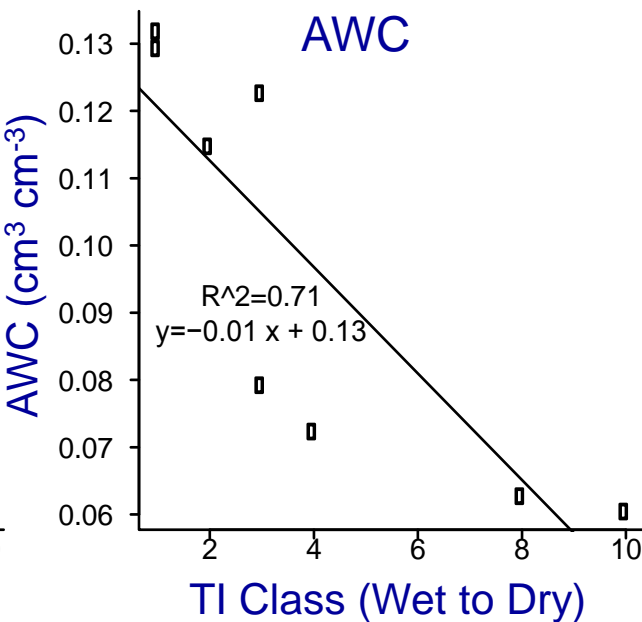

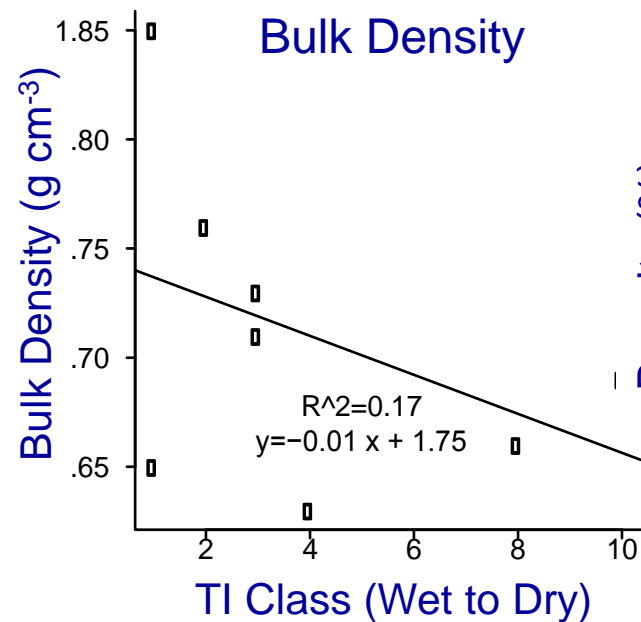

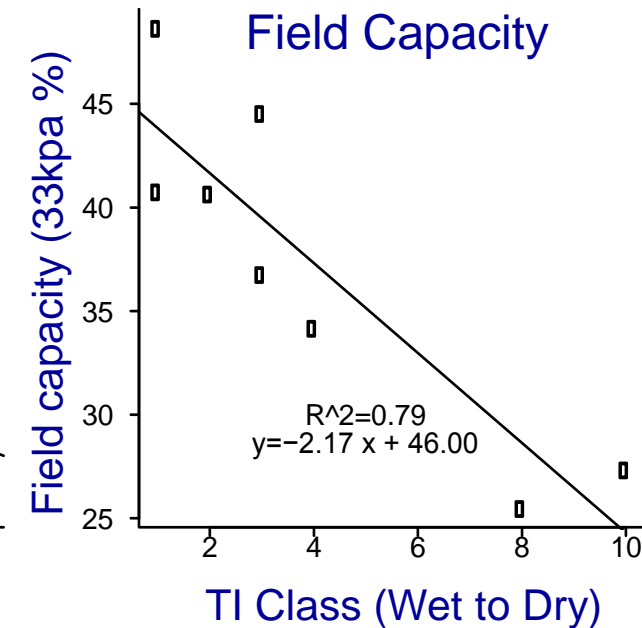

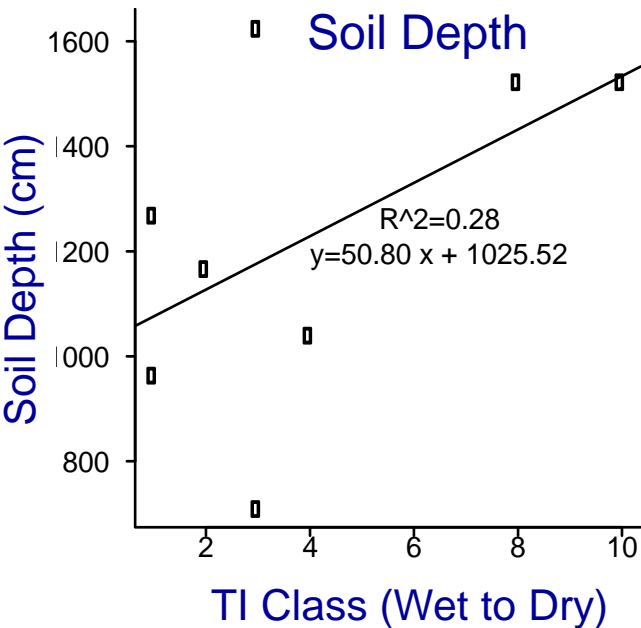

Easton et al. 2008
Collick et al. 2014
Fuka et al. 2015

Hortonian Dominated Systems

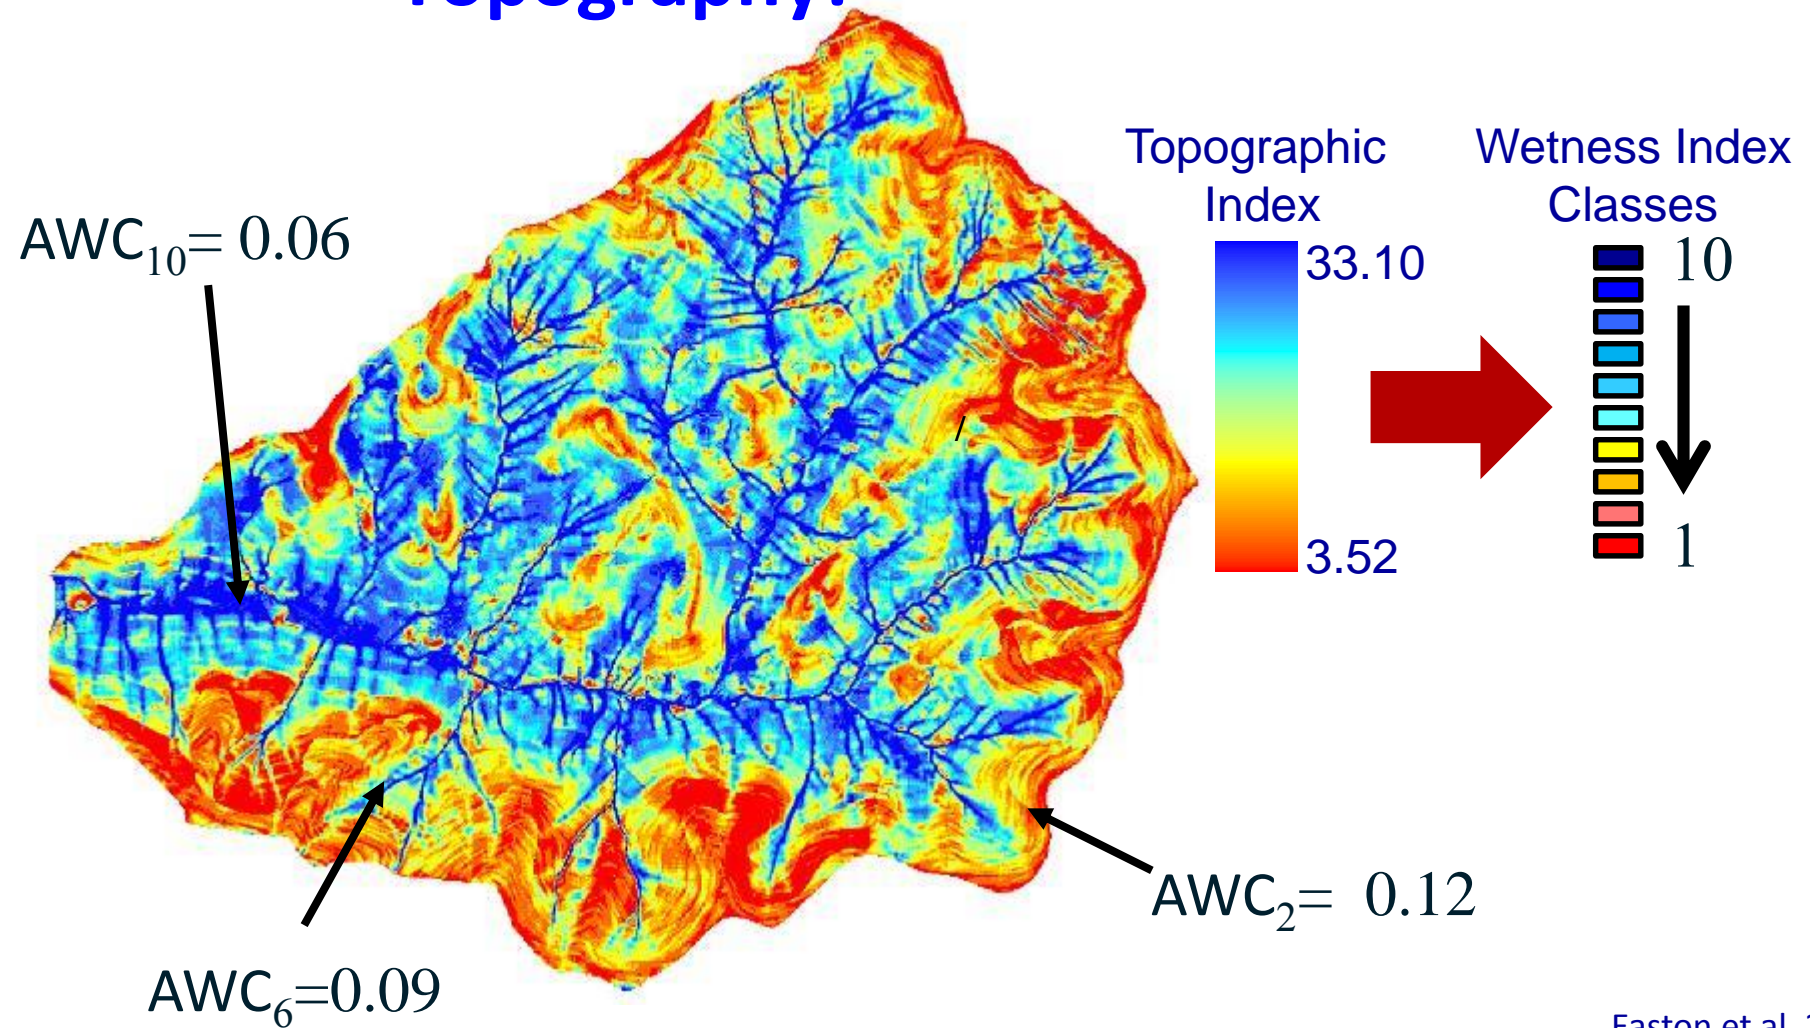

Riesel, TX, USA

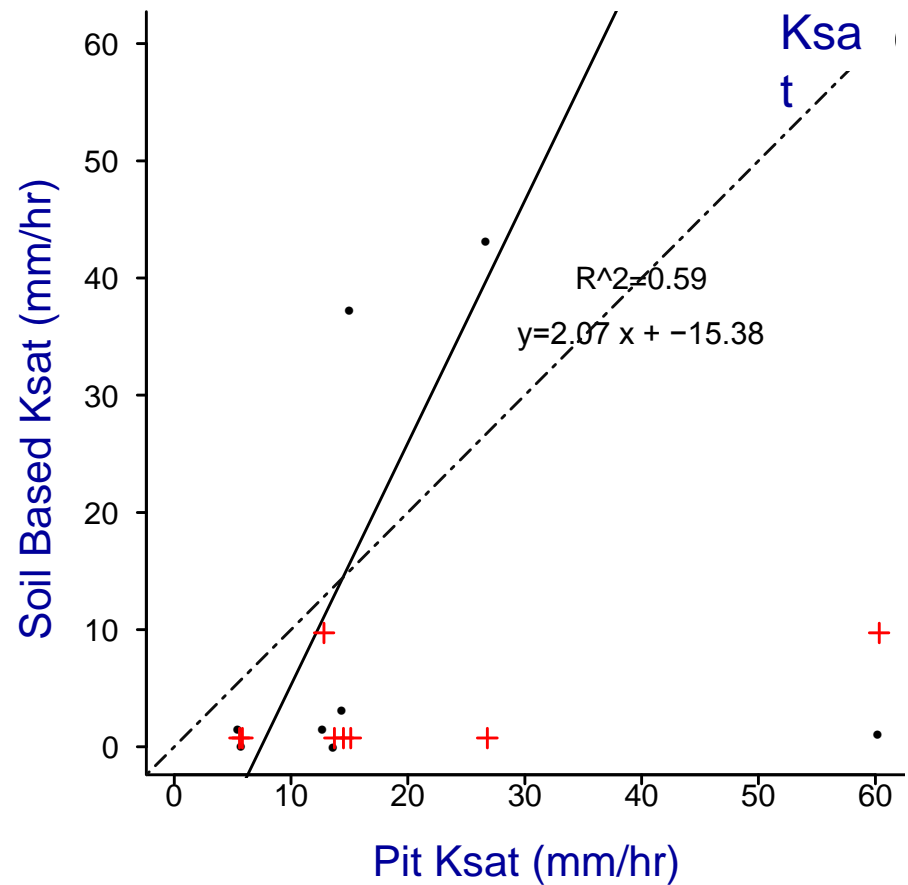

Soil genesis as explained by Topography!

$$f = \ln \frac{a}{\tan b}$$

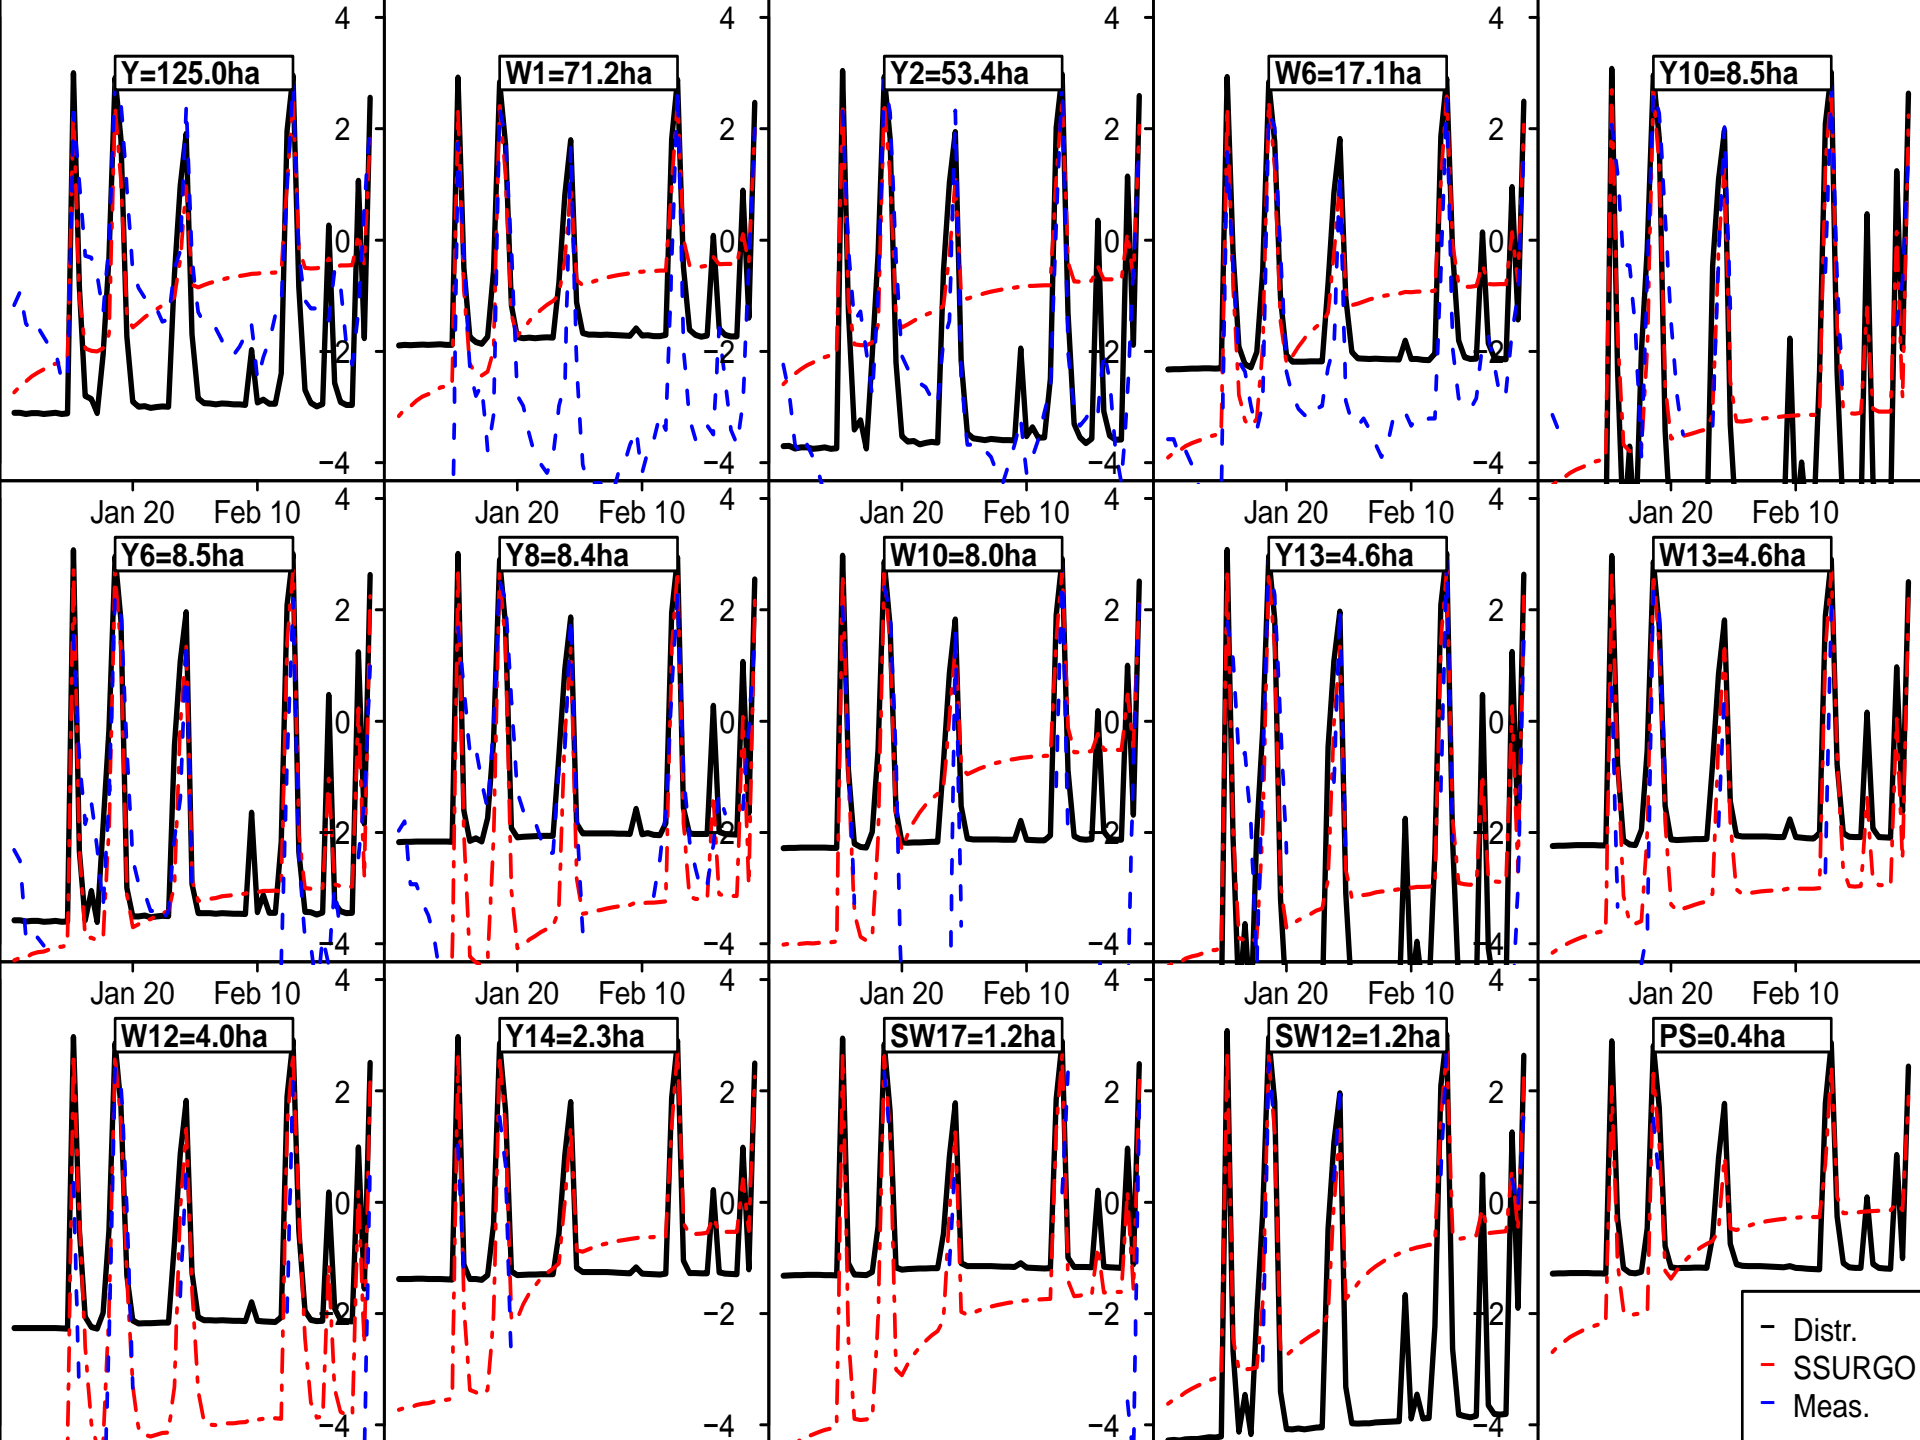

Easton et al. 2008
Collick et al. 2014
Fuka et al. 2015

How does SSURGO perform?

TI adjusted FAO Soils (●) vs base SSURGO Soils (+)

Conclusions

- Data Brokering can increase the speed and repeatability of initialization and provide multiple data sources in (SWAT) specific formats
 - Users don't have to understand multiple formats
- SSURGO initialization captured soil properties and this hydrologic response poorly
 - Sometimes under predicting and sometimes over predicting, in part due to the overestimated soil depth and AWC
- TI initialization better captured soil characteristics and as a result hydrologic response
 - This can be used to inform spatially targeted agricultural and water resource management decisions
