# Introduction (Cont.)

- Recent data revealed annually 1 to 5.4% of grassland is being converted to cropland in the Western Corn Belt (WCB).
- Across WCB, more than 99% of pre-settlement tallgrass prairie has been converted to other lands, mostly to agricultural land.
- This land cover conversion in the WCB can present critical ecosystem issues.

# Introduction (Cont.)

| State        | Grassland to corn/soy | Corn/soy to grassland | Grassland net loss |
|--------------|-----------------------|-----------------------|--------------------|
| North Dakota | 129 (320)             | 40 (100)              | 89 (220)           |
| South Dakota | 256 (632)             | 73 (181)              | 182 (451)          |
| Minnesota    | 92 (228)              | 13 (31)               | 80 (196)           |
| Iowa         | 195 (481)             | 42 (104)              | 152 (376)          |
| Nebraska     | 125 (309)             | 100 (247)             | 25 (62)            |
| Sum          | 797 (1,969)           | 268 (663)             | 528 (1,306)        |

# Objective

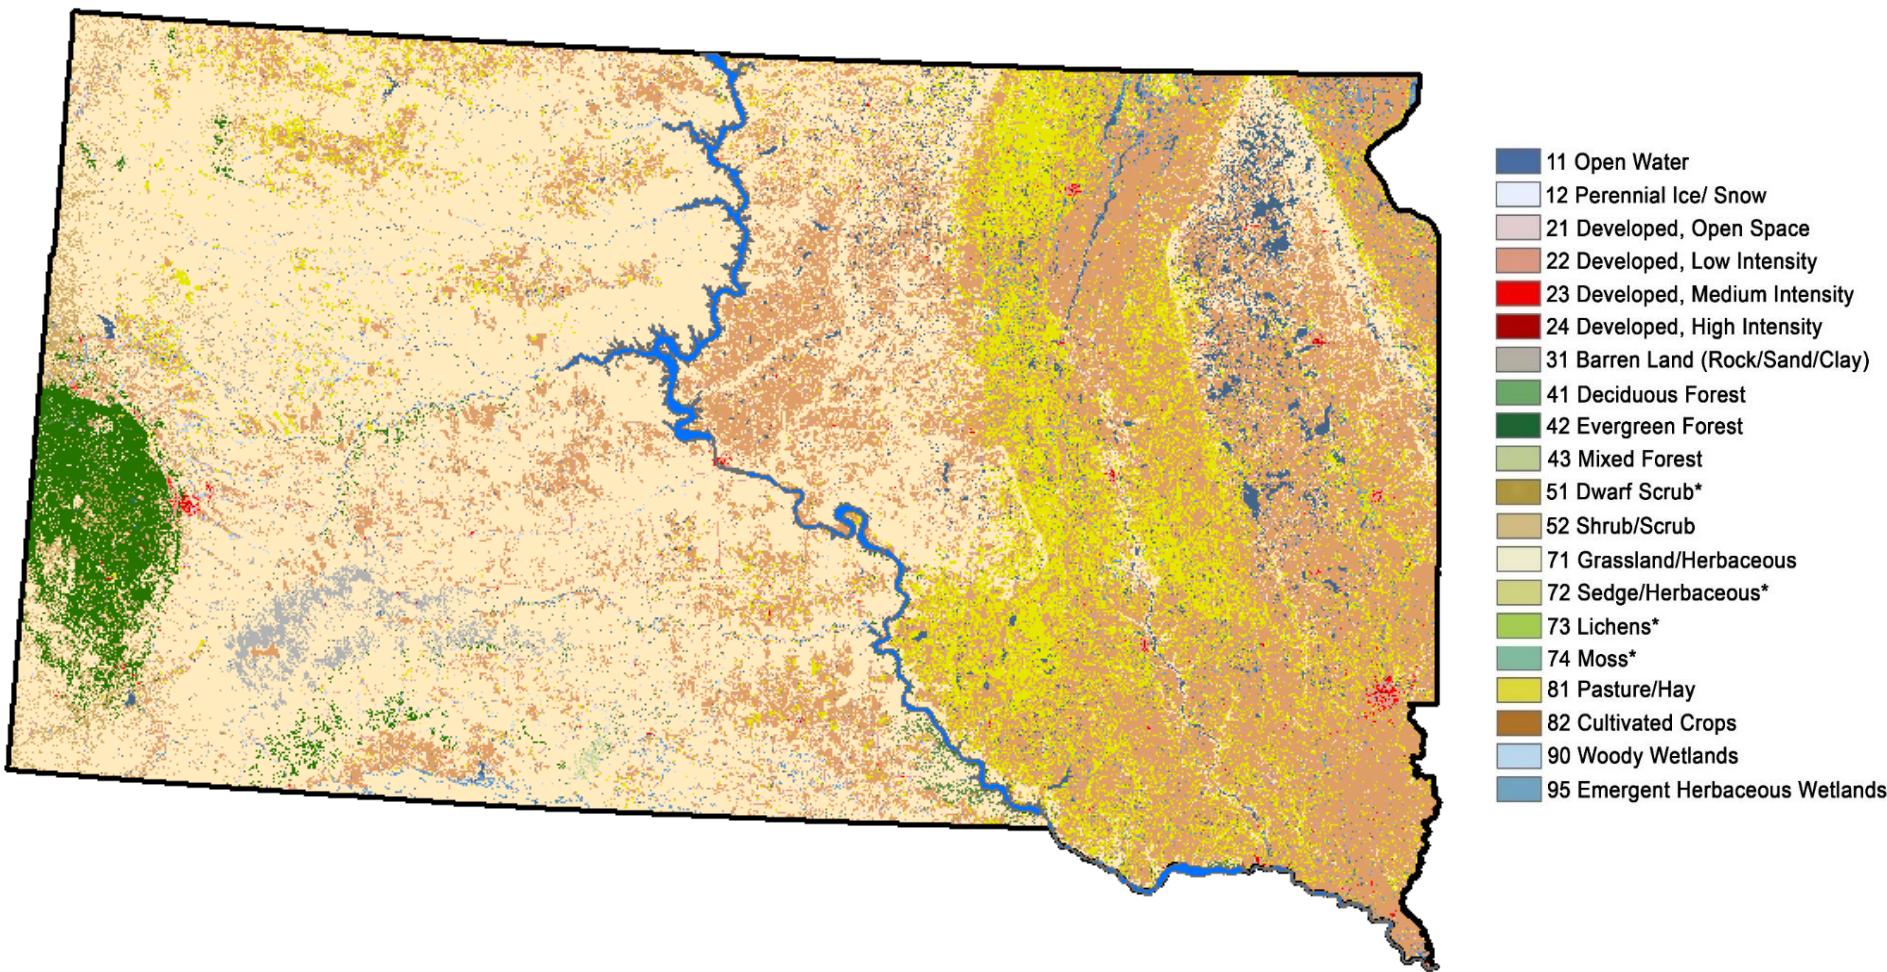

To characterize hydrologic changes that possibly occurred in South Dakota between two recent decades (the 1980s and 2000s).

# Methodology

| Data Use   | Study Period  | Model   | Statistical Analysis  |
|--|---|---|---|
| <ul style="list-style-type: none"><li>• Daily Precipitation (National Oceanic and Atmospheric Administration (NOAA))</li><li>• Daily Maximum and Minimum Temperature (National Oceanic and Atmospheric Administration (NOAA))</li><li>• Daily Streamflow (U.S. Geological Survey (USGS))</li><li>• Land Use and Land Cover Data (National Land Cover Dataset 1992 (NLCD 1992) and (NLCD 2011))</li></ul> | <ul style="list-style-type: none"><li>• 1981-1990</li><li>• NLCD 1992</li><li>• 2005-2014</li><li>• NLCD 2011</li></ul> | <ul style="list-style-type: none"><li>• Soil and Water Assessment Tool (SWAT)</li></ul> | <ul style="list-style-type: none"><li>• Nash-Sutcliffe Efficiency (NSE)</li><li>• Coefficient of Determination (<math>R^2</math>)</li><li>• Percent Bias (PBIAS)</li><li>• Wilcoxon change test</li></ul> |

## Calibration Parameter

|                               |          |  |
|-------------------------------|----------|--|
| <b>Streamflow Calibration</b> | ALPHA_BF | Baseflow alpha factor  |
|                               | ESCO     | Evaporation compensation coefficient   |
|                               | EPCO     | Plant uptake compensation factor   |
|                               | CANMX    | Maximum canopy storage   |
|                               | CN2      | Initial SCS runoff curve number for moisture condition II  |
|                               | Ch_N2    | Manning's "n" value for the main channel   |
|                               | Ch_K2    | Effective hydraulic conductivity in main channel alluvium (mm/hr)  |
|                               | GW_DELAY | Groundwater delay time (days).   |
|                               | GW_REVAP | Groundwater "revap" coefficient  |
|                               | Gwqmn    | Threshold depth of water in the shallow aquifer required for return flow to occur (mm H20)                     |
|                               | Revapmn  | Threshold depth of water in the shallow aquifer for revap or percolation to the deep aquifer to occur (mm H2O) |
|                               | Surlag   | Surface runoff lag coefficient   |
|                               | SFTMP    | Snowfall temperature   |
|                               | SMTMP    | Snow melt base temperature   |
|                               | SMFMX    | Melt factor for snow on June 21  |
|                               | SMFMN    | Melt factor for snow on December 21  |
|                               | TIMP     | Snow pack temperature lag factor   |

SWAT Share enables users to upload, share and edit their SWAT input data, run their uploaded model, download the output file, and visualize output results. For detailed information, please refer to the [user manual](#).

College of Agriculture and Biological Sciences

# Conclusion

- BRW and SCW experienced grassland loss with the expansion in agricultural and urban areas (1.4% and 5.2%, respectively) and in the UBSRW was mostly derived from expansion of wetlands (4.8%).
- Climate variability appears with a slight precipitation increase in BRW and UBSRW, and slightly decreased in the SCW during 2005-2014 relative to 1981-1990.
- Comparison of watershed-scale average annual water budget components between the two decades indicates significant increase in soil water content and percolation in BRW and UBSRW and water yield in SCW.
- Analysis of seasonal variability between the two time periods revealed a notable shift in surface runoff in SCW from June to March and in UBSRW from March to April.
- ET shows a distinctive change in the summer growing season for all three watersheds.
- Based on the sub-basin scale spatial evaluation, downstream parts of BRW and SCW, and the western part of UBSRW experienced more changes in hydrology.

# Future Plan

- Analyze the effects of projected climate change scenarios with existing land use on water resources.
- Analyze the effects of projected land use change scenarios with existing climate condition on water resources.
- Analyze the combined effects of climate change and land cover change on water resources in South Dakota.
