Event-based rainfall-runoff models are effective tools in hydrological forecasting and preparedness for extreme events.

Distributed models have the advantage of parameter distribution over the watershed.

Parameter optimization is carried out with different hydrological models and optimization techniques.

In PSO, optimisation is carried by either maximizing or minimising the objective function (fitness value).

The main aim of this study is to optimise the parameters of the selected hydrological model.
METHODOLOGY

Start

Input Data

Calibrate hydrological model parameters

Simulate runoff using calibrated parameters

Compare observed simulated runoff

output

Hydrological model parameters

PSO model parameters

Fig 1: Flowchart for parameter optimisation using PSO
Step 1: Initialising PSO parameters

Step 2: Defining the Objective Function

Step 3: Evaluation of each particle’s position according to the objective function

Step 4: Comparison and updation of a particle’s current position to its previous best position

Step 5: Determination of the best particle (according to the particle’s previous best positions)
PSO Algorithm

Step 6: Updation of particles’ velocities:

\[ V_{i,j}^{k+1} = \omega \times V_{i,j}^{k} + c_1 \times r_1 \times (P_{best_{i,j}}^{k} - X_{i,j}^{k}) + c_2 \times r_2 \times (G_{best_{i,j}}^{k} - X_{i,j}^{k}) \]

Inertia: Makes the particle move in the same direction and with the same velocity.

PI: Improves the individual. Makes the particle return to a previous position, better than the current.

SI: Makes the particle follow the best neighbors direction.
PSO Algorithm

Step 7: Updation of particles’ position

\[ X_{i,j}^{k+1} = X_{i,j}^k + V_{i,j}^{k+1} \]

Step 8: Step 3 to Step 7 are repeated until stopping criteria is satisfied
The objective function of PSO: Minimise

\[ E = 1 - \frac{\sum_{i=1}^{n}(Q_f^i - Q_o^i)^2}{\sum_{i=1}^{n}(Q_o^i - \bar{Q}_o)^2} \]

where \( Q_f^i \): forecasted discharge, \( Q_o^i \): observed discharge, \( \bar{Q}_o \): mean of observed discharge,

In this study, commonly used parameters of PSO algorithm are set as:

- Inertia weight (\( w_{\text{max}}, w_{\text{min}} \)): 0.9 to 0.4
- Acceleration factor (\( c1, c2 \)): 2 to 2.05
- Population size: 50
- Maximum iterations (Max): 100
- Initial velocity: 10 % of position
A computationally well-organized KW-FEM model is adopted for rainfall-runoff simulation

Reddy (2011) developed the model based on application of kinematic-wave theory for surface runoff and Finite Element Method

Prominent hydrological processes like infiltration, overland flow and channel flow have been considered in this model

\[
f_p = K_s [1 + \frac{M_s}{F}]
\]

\[
[C][h]^{t+\Delta t} = [C][h]^t - \Delta t[B]\{(1 - \omega)q^t + \omega q^{t+\Delta t}\} + \Delta t[f]\{(1 - \omega)q^t + \omega R^{t+\Delta t}\}
\]

\[
[C][A]^{t+\Delta t} = [C][A]^t - \Delta t[B]\{(1 - \omega)Q^t + \omega Q^{t+\Delta t}\} + \Delta t[f]\{(1 - \omega)q^t + \omega q^{t+\Delta t}\}
\]
where

\( f_p \) - infiltration capacity,
\( K_s \) - saturated hydraulic conductivity,
\( M \) - Initial moisture deficit,
\( s_c \) - Capillary suction at the wetting front,
\( F \) - cumulative infiltration,
\([C]\) - Global capacitance matrix,
\( h \) - Depth of flow in the vertical direction,
\( t \) - time, delta t-time step,
\([B]\) - global gradient matrix,
\( \{f\} \) - Global forcing term vector,
\( q \) - lateral inflow per unit width of flow plane,
\( r_e \) - excess rainfall rate,
\( \omega \) - factor which depends on type of finite difference scheme,
\( A \) - area of flow in channel

SUMMARY AND CONCLUSIONS

Parameter optimisation improves the hydrograph

Optimisation of parameters reduces the number of iterations to be performed, thereby increasing the computational speed

The manual intervention is avoided and the optimisation process stops after the simulated flow approaches observed flow

PSO optimization method is a simple, robust, efficient and effective algorithm in searching optimal rainfall-runoff model parameters

Automatic calibration of the rainfall-runoff model parameters using PSO algorithm is being applied for Banha and Khadakohol watersheds.
