**Introduction**

- Under the increasing threats of climate and land use change, fresh water availability will eventually become a limiting resource for many regions across the globe in the near future.
- The dynamics of water availability within a region can be analyzed in multiple ways, including statistical methods, sensitivity based methods and distributed hydrologic modeling.
- This study aims to quantify the water availability (i.e., blue and green water dynamics) of Metro Water District (MWD) basin. The Soil and Water Assessment Tool (SWAT) is adopted to assess the hydrologic phenomena.
- Here, SWAT is a semi distributed and physical based hydrological model, it contains enormous number of parameters to capture the hydrological regime which leads to high complexity and computational burden during calibration. Where, Meta models are cheap simulators to represent input-output response of physical simulation models, it helps to minimize the computational burden and increases the model consistency. Hence, Adaptive Meta Modelling based Optimization (AMMO) framework is implemented for calibration of SWAT watershed model.

---

**Results and Conclusions**

- **Figure 1:** Map showing of Upper Chattahoochee River basin.

**Figure 2:** Framework of SWAT and AMMO algorithm

**Figure 3:** Spatial analysis over a period of 10 years in UCR.

**Figure 4:** Assessment of blue and green water dynamics from approximated UCR SWAT model.

---

**Importance of Study**

- Study analyses will help regional water boards in planning, designing, and managing respective systems as per the future climate change.

**Virtual Identity**

**Details**

- **Location**: Georgia state, USA
- **Name of the watershed**: Upper Chattahoochee River (UCR)
- **Area of the Watershed**: 4291.87 km²
- **Elevation range**: 19.4 to 135.3 m, based on DEM
- **Dominant Land use**: Imperviousness
- **Dominant Soil**: Cecil-Madison-Pacolet
- **Annual Streamflow and Precipitation**: 14,725 m³ / sec - 178.113 m³ / sec, 1346.2 mm to 1524 mm per year.

**Data Sources**

- **Streamflow**: United States Geological Survey (USGS) Current Water database
- **Precipitation**: National Climatic Data Center (NCDC) database
- **Digital Elevation Model (DEM)**: National Hydrography Dataset (NHD)
- **Land Use and Land Cover (LULC)**: National Land Cover Dataset (NLCD)
- **Soil data**: USSTASTGO
