Field Scale Phosphorus and Sediment Modeling

OKLAHOMA STATE UNIVERSITY

Biosystems and Agricultural Engineering Department

Project Objectives

- Estimate reduction in P and sediment loads from implementing conservation practices from 238 fields sites in the North Canadian watershed using TBET, a simplified SWAT interface
- Evaluate the cost efficiency for both the landowner and the federal government per kg of P and ton of sediment reduced

Why is this important?

Leads to the implementation of more cost effective practices and an improvement in the overall effectiveness of water quality programs

Field Scale Phosphorus and Sediment Modeling

North Canadian Watershed in NW Oklahoma, USA

- 1,790 km² drainage area
- Wheat and cattle producing area
- Streams impaired due to nutrients and sediment

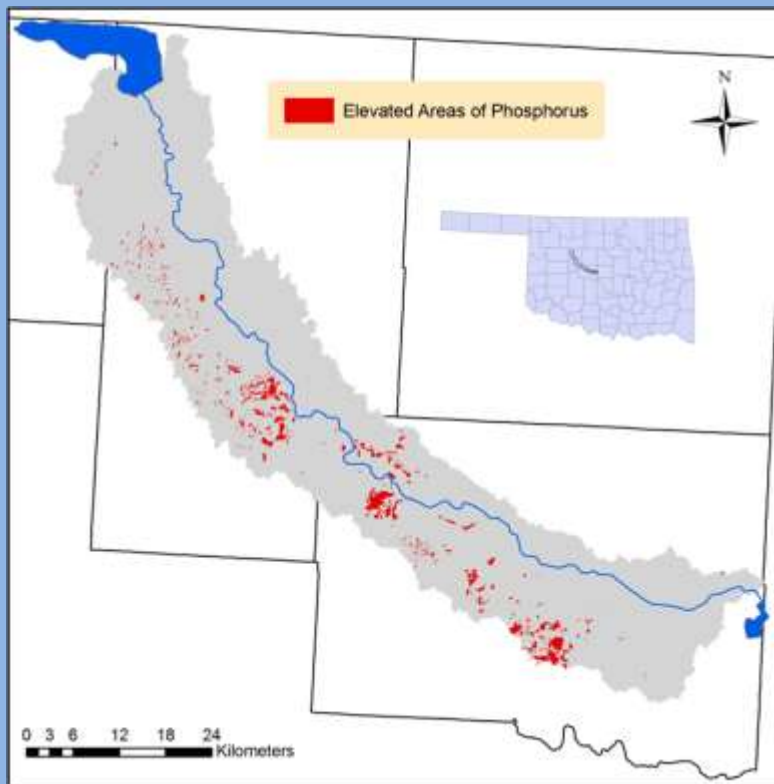

Field Scale Phosphorus and Sediment Modeling

OKLAHOMA STATE UNIVERSITY

Biosystems and Agricultural Engineering Department

SWAT Model to Simulate Phosphorus Loads

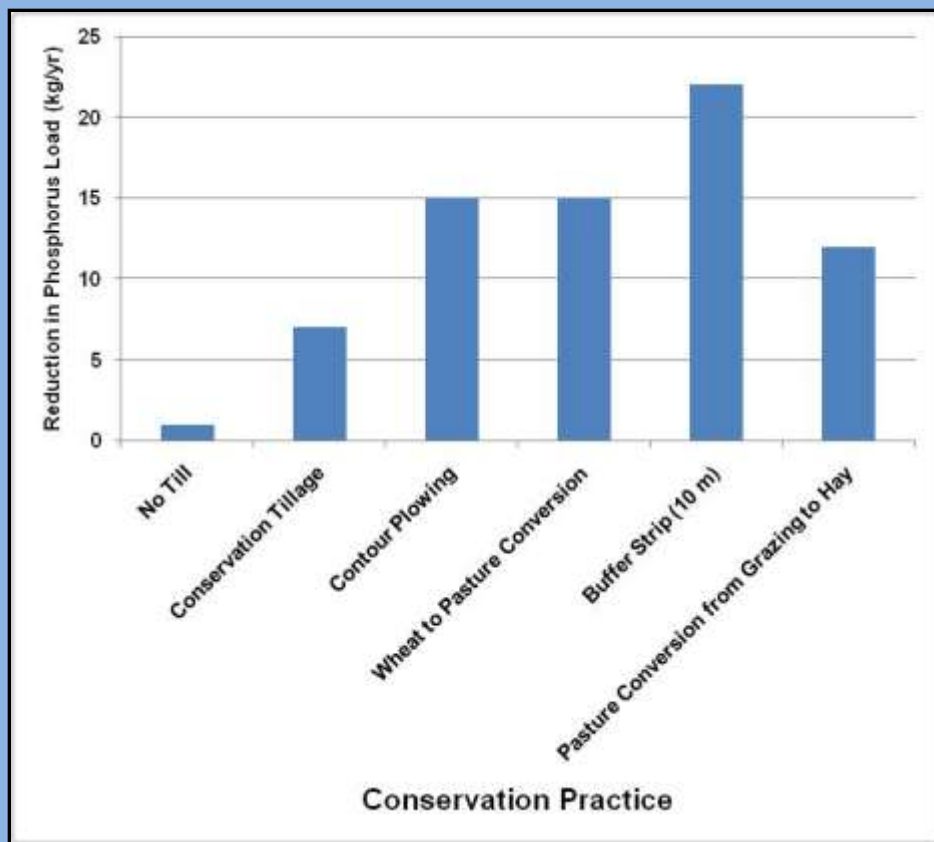

- SWAT model utilized to identify targeted areas (fields with elevated P loads)
- 60% of P contribution from 20% of land area
- Non-urban landcovers with elevated P loads
 - small grains
 - row crops
 - bare soil

Field Scale Phosphorus and Sediment Modeling

OKLAHOMA STATE UNIVERSITY
Biosystems and Agricultural Engineering Department

Best Management Practice Scenarios

- Simulated P load reductions from various conservation practices
- Largest P load reductions
 - 10 m buffer strips
 - Contour plowing
 - Converting wheat to pasture

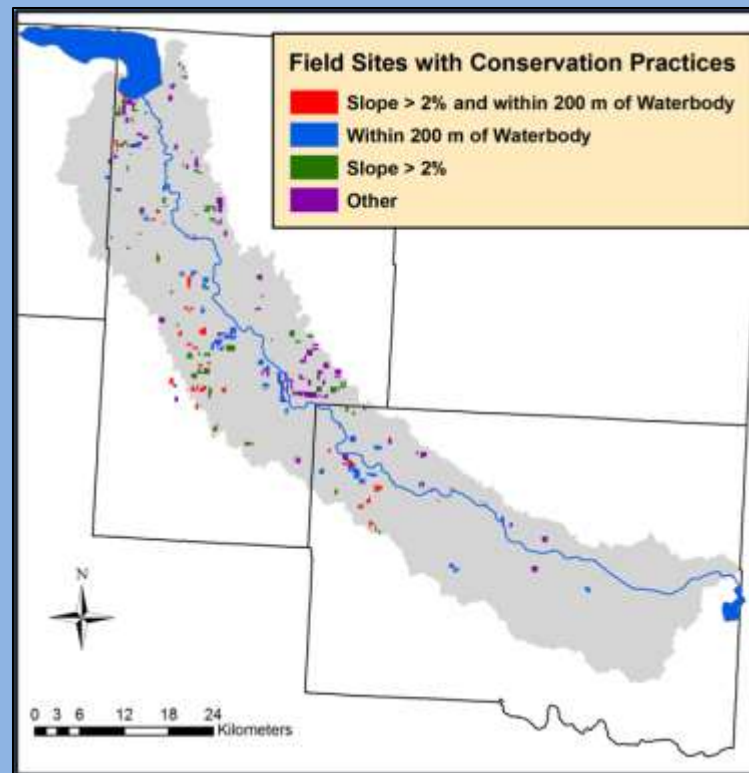

Field Scale Phosphorus and Sediment Modeling

OKLAHOMA STATE UNIVERSITY
Biosystems and Agricultural Engineering Department

Implementation of Conservation Practices

- Six types of conservation practices implemented in the basin to reduce P and sediment loads
- US Environmental Protection Agency Section 319(h) project
- Implemented on 238 field sites (65 km²) targeting elevated areas
- Landowner participation major factor
- Mutual occurrence on 44 of 238 field sites (14 km²)

Conservation Practices

No Till

Buffer Strips

**Riparian
Exclusion**

**Wheat Conversion to
Bermuda or Native Range**

Field Scale Phosphorus and Sediment Modeling

OKLAHOMA STATE UNIVERSITY

Biosystems and Agricultural Engineering Department

Model to Estimate Reductions Due to Conservation Practice Implementation

- TBET chosen to estimate P and sediment load reductions
- Easy to use and applicable at the field scale
- Based on SWAT
- Designed to put the predictive power of a complex model into the hands of people who make daily decisions that affect water quality

Field Scale Phosphorus and Sediment Modeling

OKLAHOMA STATE UNIVERSITY

Biosystems and Agricultural Engineering Department

TBET Simulation Results

- Average P reduction
 - 4,200 kg/yr
 - 0.65 kg/ha/yr
 - 9 percent annual reduction
- Average sediment reduction
 - 3,000 tons/yr
 - 0.47 tons/ha/yr
- Largest P reduction
 - riparian exclusion with conservation buffer
- Largest sediment reduction
 - Wheat to Bermuda

- ***‘converting wheat to Bermuda’*** compared to ***‘conservation tillage’***
 - Mann-Whitney Ranked Sums Test
 - median P reduction not significantly greater
 - median sediment reduction was significantly greater

Field Scale Phosphorus and Sediment Modeling

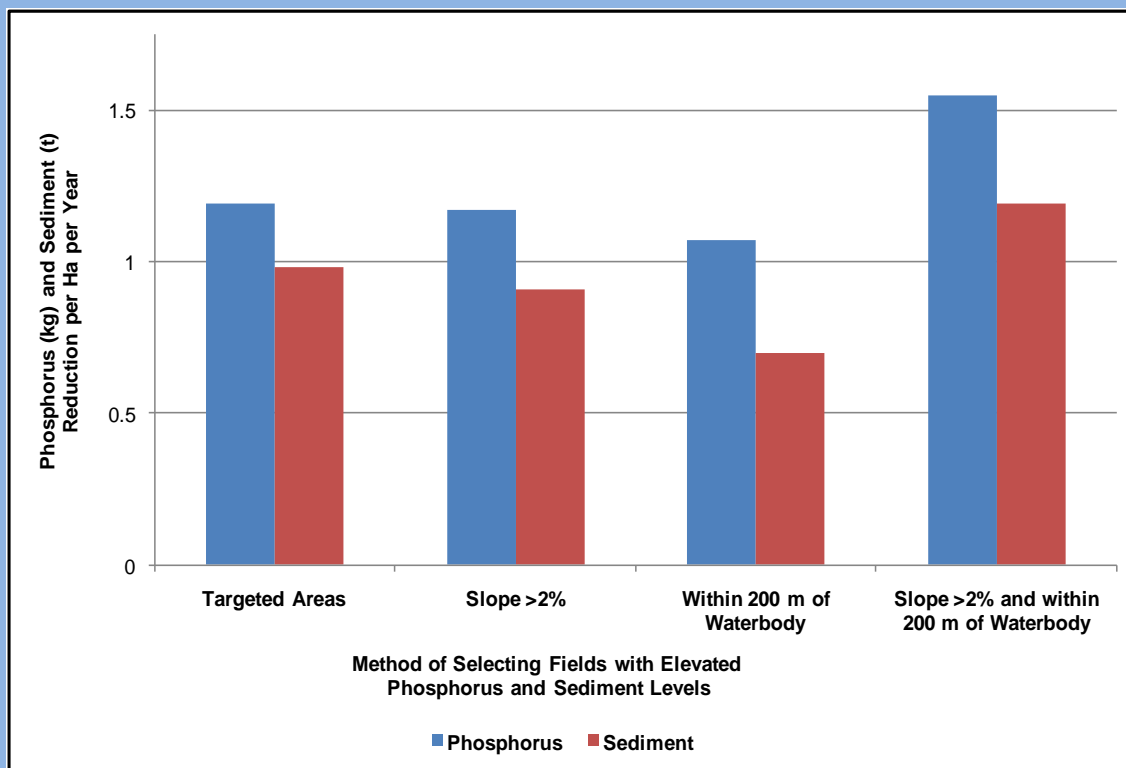

OKLAHOMA STATE UNIVERSITY

Biosystems and Agricultural Engineering Department

Forty of the 238 Field Sites Previously Identified as Targeted Areas

Significantly greater reductions compared to non-targeted areas

- Phosphorus (1.13 vs. 0.41 kg/ha/yr; 180%)
- Sediment (0.88 vs. 0.24 tons/ha/yr; 370%)

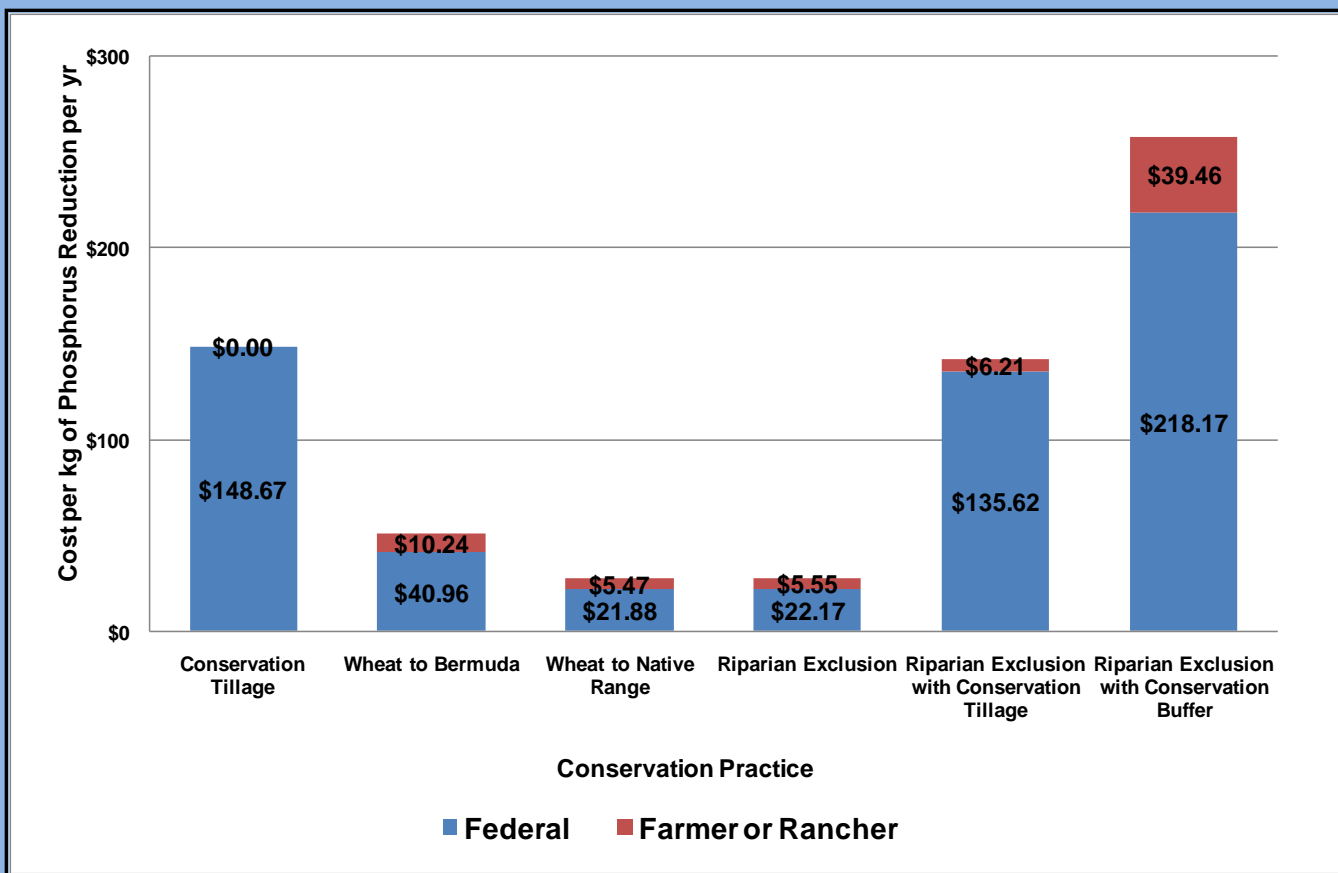

Field Scale Phosphorus and Sediment Modeling

OKLAHOMA STATE UNIVERSITY

Biosystems and Agricultural Engineering Department

Cost of Phosphorus Reduction

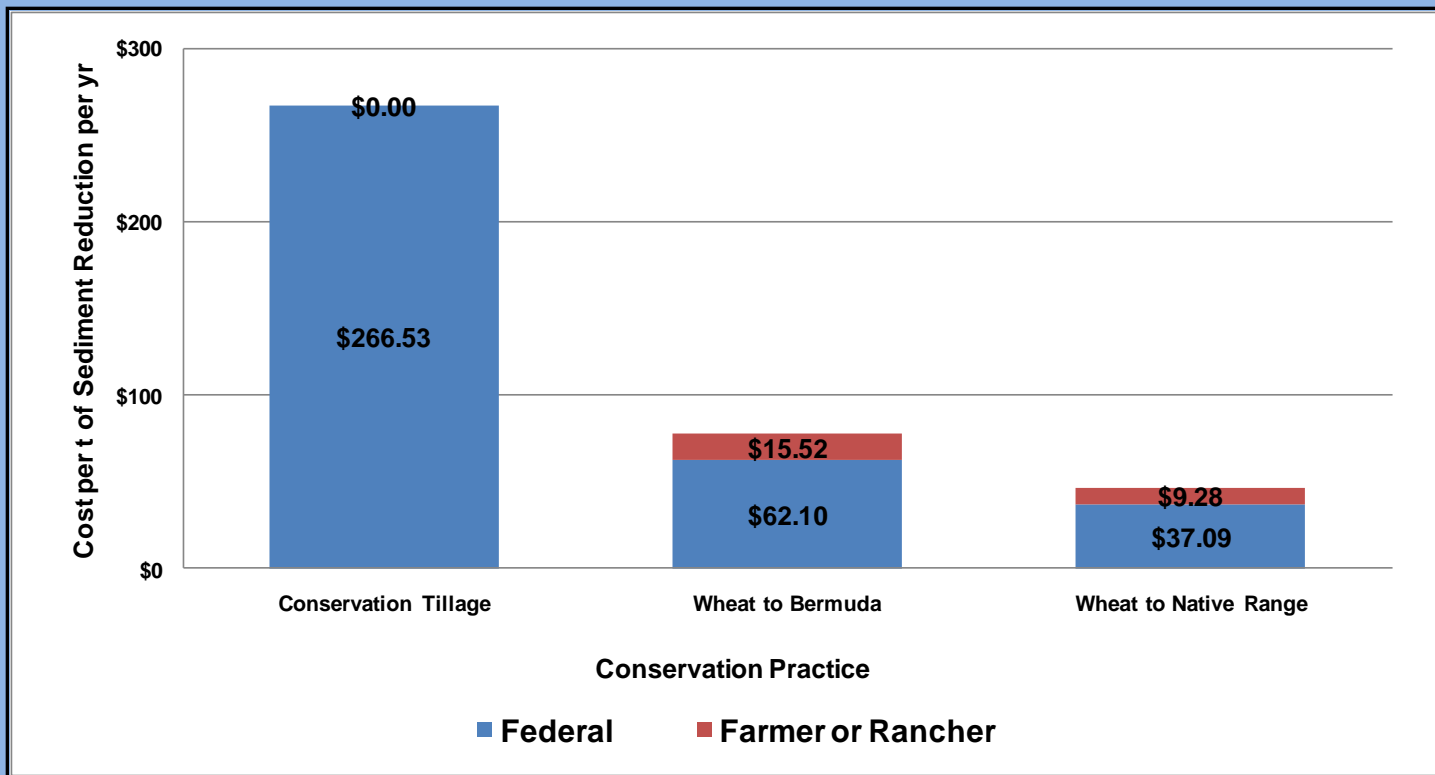

Field Scale Phosphorus and Sediment Modeling

OKLAHOMA STATE UNIVERSITY
Biosystems and Agricultural Engineering Department

Cost of Sediment Reduction

Project Implications

- Costs to landowner to implement conservation practices must be considered
- Cost per mass of pollutant must be the primary consideration when setting cost share rates
- TBET provided an easy to use and cost effective and efficient tool to provide information to help determine cost share rates for new water quality programs
