

Hydrologic assessment in a Brazilian forest watershed using SWAT model

Nadia Bernardi Bonumá; C. W. Corseuil;
C. G. Rossi; M. Kobiyama; P R. Zanin

MOTIVATION

The Iguaçu River basin (68,410 km²) is an important basin of Southern Brazil since it has the largest hydroelectric power generation capacity in Brazil.

The remainders of the **Native Forest** which formerly covered the plateau region of the Southern Brazil are now **only 2%** of its original area.

MOTIVATION

The original Araucaria (Subtropical Ombrophilous Forest) has been replaced by reforestation, agricultural activities and reservoir constructions in Santa Catarina State, Southern Brazil.

How the changes in **land use** (native forest, pine, agriculture and reservoirs operation) affect the **hydrological processes** in this region?

+

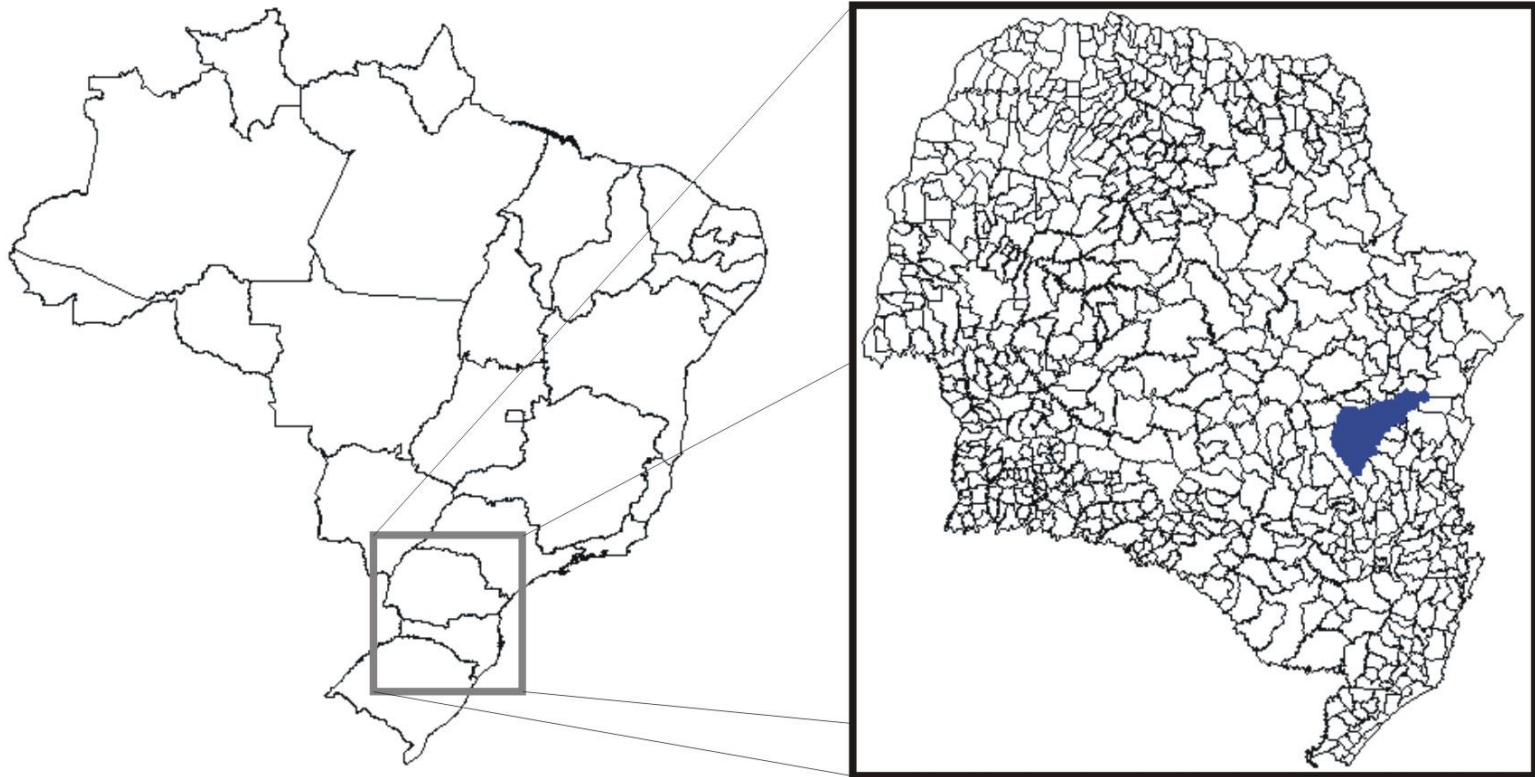

OBJECTIVES

The aim of the study was to estimate the **hydrological process** with the SWAT model for the **Rio Preto watershed**, located in the Northern Plateau of **Santa Catarina State**:

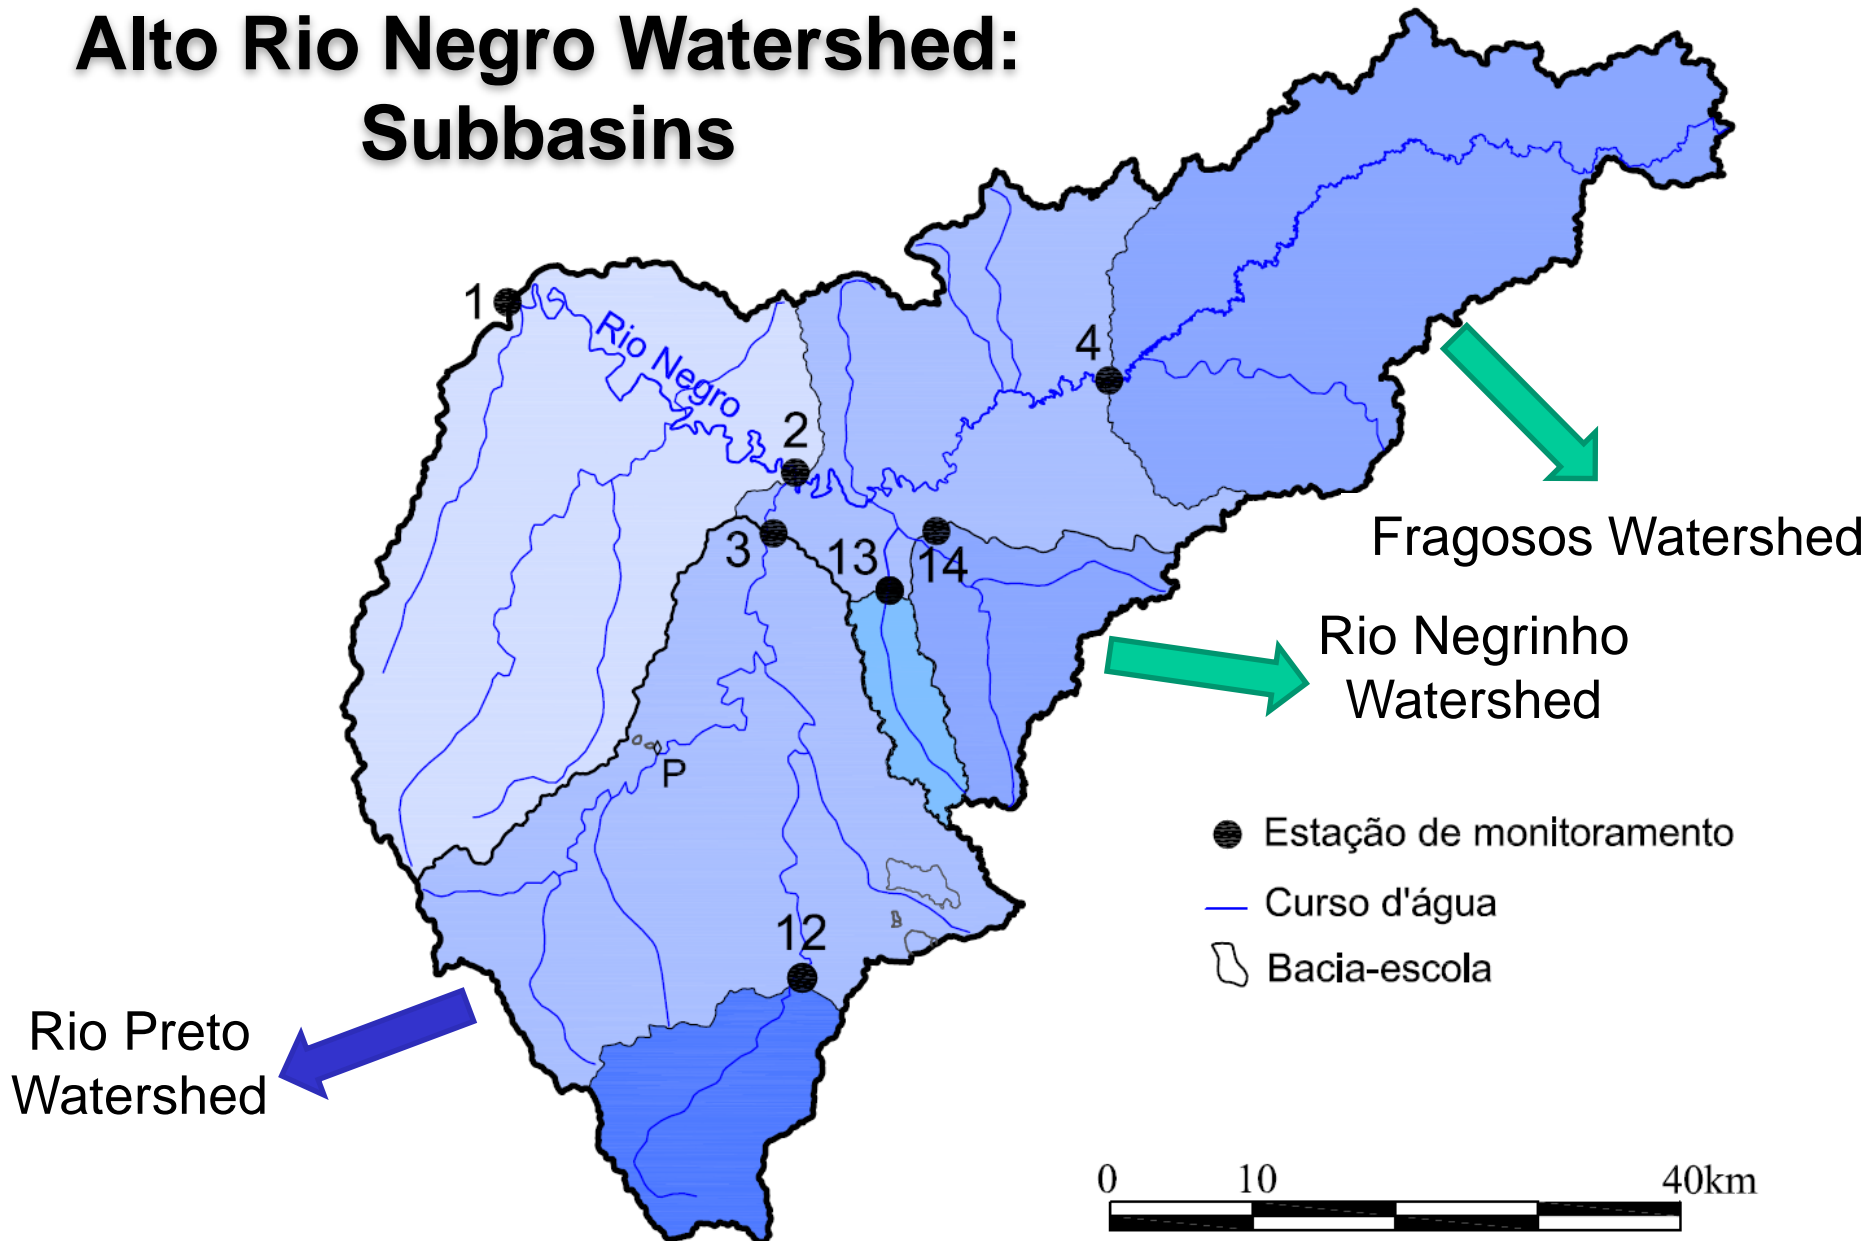

- i. To assess the **water balance** simulated with SWAT model;
- ii. Compare **measured** and **simulated streamflow**.
- iii. To conduct model sensitivity analysis to selected parameters.

Alto Rio Negro (Upper Negro River) Watershed

- Santa Catarina and Parana States;
- Area: 3454 km²;
- Topography: hilly (Average altitude - 910 m) ;
- Annual rainfall: 1700 mm

Alto Rio Negro Watershed: Subbasins

Rio Preto Watershed:

RESULTS AND DISCUSSION

Water Balance:

| Month | PREC (mm) | SURF Q (mm) | LAT Q (mm) | WY (mm) | ET (mm) | PET (mm) |
|-------------|---------------|--------------|-------------|--------------|--------------|---------------|
| Jan | 196 | 55.42 | 0.63 | 83.76 | 82.89 | 165.37 |
| Feb | 154.65 | 37.53 | 0.63 | 67.66 | 78.39 | 179.22 |
| Mar | 118.17 | 26.13 | 0.67 | 62.16 | 67.95 | 136.98 |
| Apr | 88.55 | 22.5 | 0.61 | 55.48 | 47.23 | 98.69 |
| Mai | 114.98 | 40.88 | 0.58 | 69.09 | 35.14 | 78.97 |
| Jun | 121.25 | 36.93 | 0.55 | 62.27 | 31.45 | 79.38 |
| Jul | 138.01 | 43.93 | 0.62 | 76.26 | 44.37 | 107.13 |
| Ago | 100.96 | 30 | 0.61 | 66.91 | 57.89 | 143.99 |
| Sep | 159.34 | 46.12 | 0.58 | 76.58 | 61.97 | 145.27 |
| Oct | 185.19 | 55.87 | 0.67 | 89.49 | 86.96 | 175.56 |
| Nov | 150.16 | 43.21 | 0.64 | 78.74 | 82.45 | 161.26 |
| Dez | 148.13 | 36.78 | 0.62 | 69.27 | 92.73 | 178.84 |
| Mean | 139.62 | 39.61 | 0.62 | 71.47 | 64.12 | 137.56 |

The results indicated that 46% of the annual PREC is lost by ET in the watershed

RESULTS AND DISCUSSION

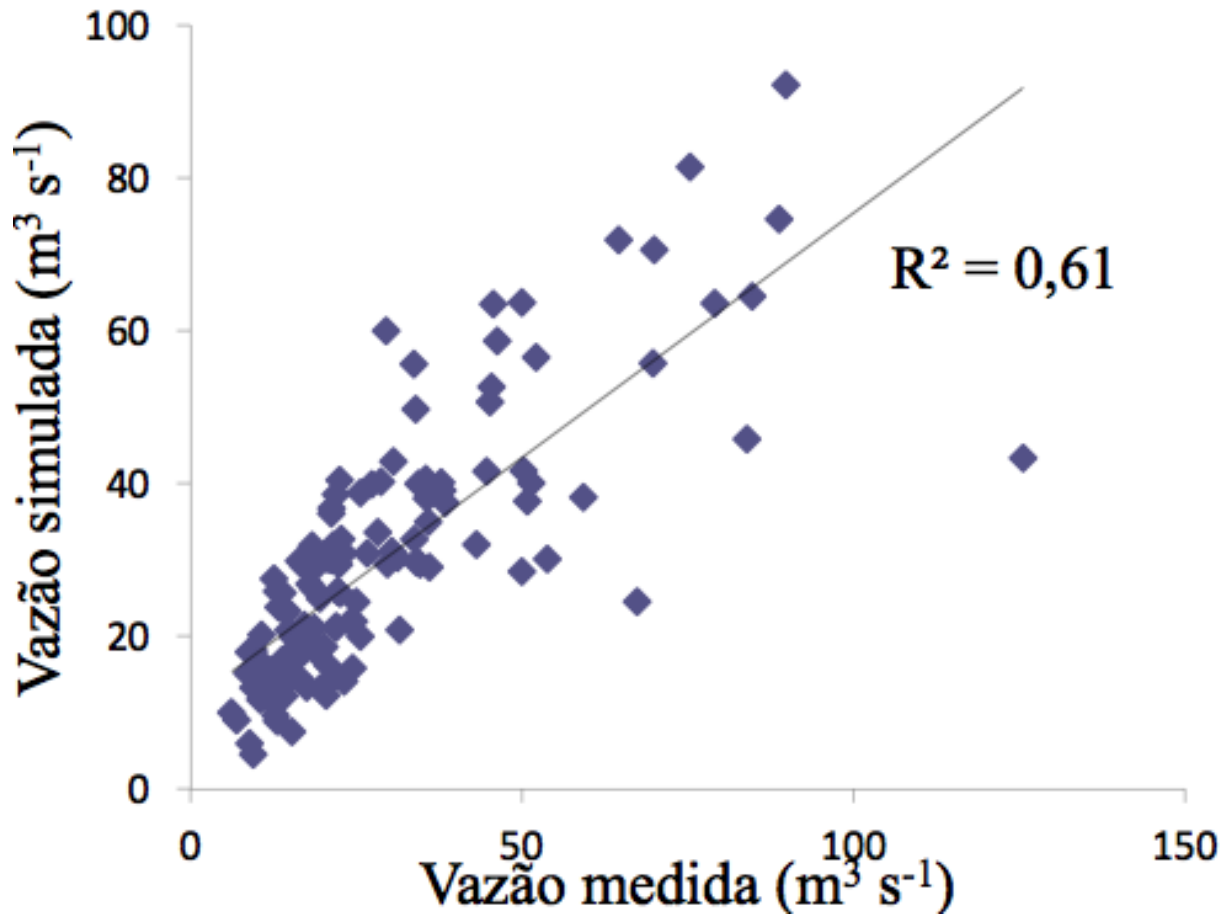

Baseflow separation:

The simulation indicated that the baseflow, which is an important component of total yield, is **54% of measured and simulated runoff.**

RESULTS AND DISCUSSION

Measured and simulated streamflow

Model performance:

$R^2 = 0.61$, NSE = 0.63

RESULTS AND DISCUSSION

Flow Duration Curves (FDC)

The FDCs of measured and simulated – to evaluate the daily streamflow variability.

The FDC derived from the simulated hydrographs indicated an underestimation of the low flows by SWAT model.

RESULTS AND DISCUSSION

Sensitivity analysis (LH)

- The **CN2** parameter's variation had the highest sensitivity. Increased values of CN2 imply an increase in the surface runoff.
- The second parameter with the greatest effect was the soil evaporation compensation factor (**ESCO**). Kannan et al. (2007) noticed that a change in the value of the ESCO affects all the water balance components.
- The third most sensitive parameter was the threshold depth of water in the shallow aquifer required for return flow to occur (**GWQMN**).

CONCLUSIONS

Performance of the model:

💧 NASH = 0.63 and $R^2 = 0.61$ for monthly simulations.

Water Balance:

💧 **ET**: 46% of the annual PREC is lost by ET in the watershed.

💧 **Baseflow**: The simulation indicated that the baseflow, which is an important component of total yield, is **54% of measured and simulated runoff**.

💧 **FDC**: **Underestimation** of the **low flows** by SWAT model.

Sensitivity Analysis:

💧 CN2, ESCO and GWQMN.

RECOMMENDATIONS

💧 Based on the results - SWAT model can be used for further analysis of the **effect of climate** and **land use changes** on **hydrological processes**.

Future work:

💧 **Data:** include a longer period of time (more data) in order to improve the simulations;

💧 **Auto-calibration:** SWAT-CUP;

💧 **Uncertainty analysis:** of measured data (Harmel and Smith, 2007) and model parameters (SWAT-CUP);

💧 **Management scenarios:** land use and climate changes.
