

*Calibration of SWAT Model in a
Small Watershed by Means of
Measured Streamflow and
Suspended Sediment Data*

**Aldrei Marucci Veiga, Bruna Ferreira da Silva,
Alexandre Kepler Soares**

**FEDERAL UNIVERSITY OF GOIÁS, SCHOOL OF CIVIL
ENGINEERING, BRAZIL**

OUTLINE

- ✚ OBJECTIVE
- ✚ MOTIVATION
- ✚ CASE STUDY
- ✚ MODEL CALIBRATION
- ✚ CONCLUSIONS

OBJECTIVE

- ✦ This research focused on the analysis of SWAT model calibration in terms of flow and sediment in a small watershed (32.78 km²) located at Goiânia, Brazil
- ✦ SWAT and SWAT-CUP softwares

GOIÂNIA, STATE OF GOIÁS, BRAZIL

- ❖ Central-Western Region
- ❖ Population: 1,300,000 (2010)
- ❖ Metropolitan area: 2,100,000 (2010)

Automatic water sampler: ISCO

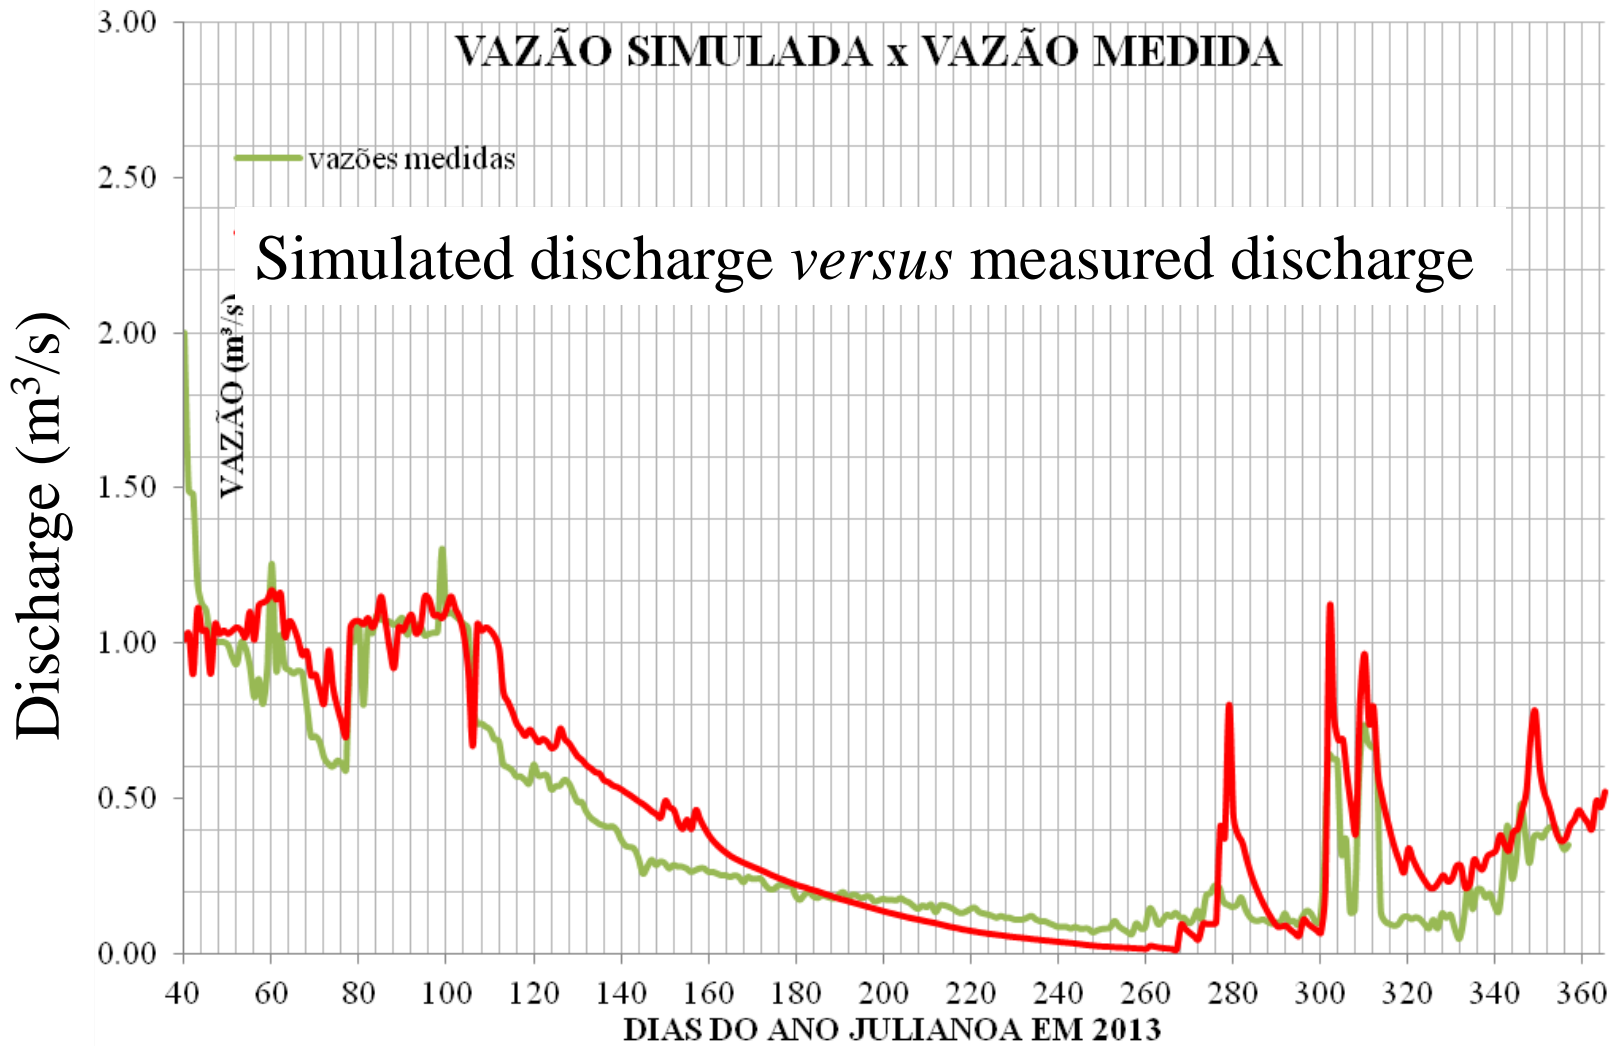

SWAT Modeling

- SWAT autocalibration
- SWAT-CUP → GLUE, ParaSol, SUFI-2
- Start with streamflow, than move to sediment

SWAT Modeling

🌀 Nash-Sutcliffe efficiency: COE = 0.80

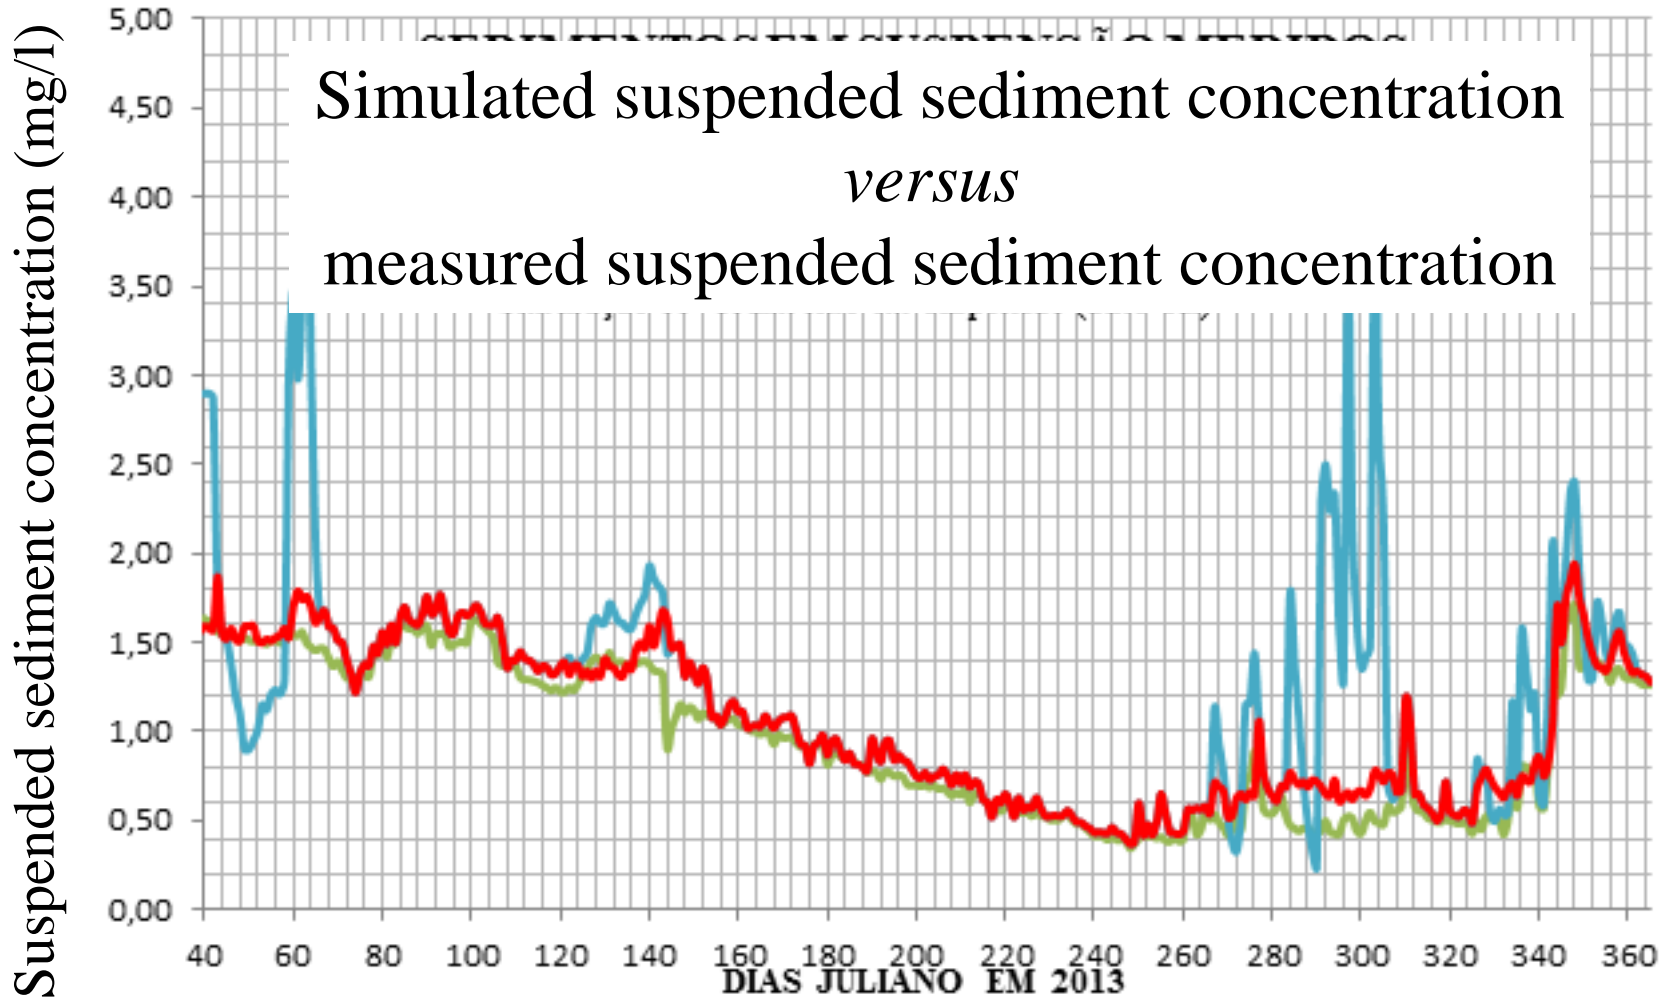

SWAT Modeling

- The CN parameter, which is related to soil type, land use, and infiltration, showed the highest sensitivity in the calibration. After that, the alpha factor of base flow was another which showed higher sensitivity
- Time of concentration → 24 hours approximately
- Permeable rocks → rapid infiltration and little overland flow → damping on rising limb of hydrograph

SWAT Modeling

🌟 Nash-Sutcliffe efficiency: COE = 0.88

SWAT Modeling

Soil & Water
Assessment Tool **SWAT**

- With regard to sediment calibration, parameters of sediment from landscape (USLE_P and USLE_C) as well as parameters of sediment from channel (SPCON and SPEXP) have shown higher sensibility

CONCLUSIONS AND FUTURE WORKS

- ✦ First analysis of calibration: expected parameters
- ✦ Improvements:
 - ❑ Data series extension
 - ❑ Water quality analyses
 - ❑ Other optimisation methods
 - ❑ Accuracy of each land use category prediction → UAV (seasonal variability?)
