

Modeling hydrologic extremes with SWAT+

Paul Wagner & Nicola Fohrer

Motivation: extreme dry conditions

- Tree mortality, soil erosion

Photos: P. Wagner 2022

Motivation: extreme wet conditions

- Flood event in Goslar
26 July 2017

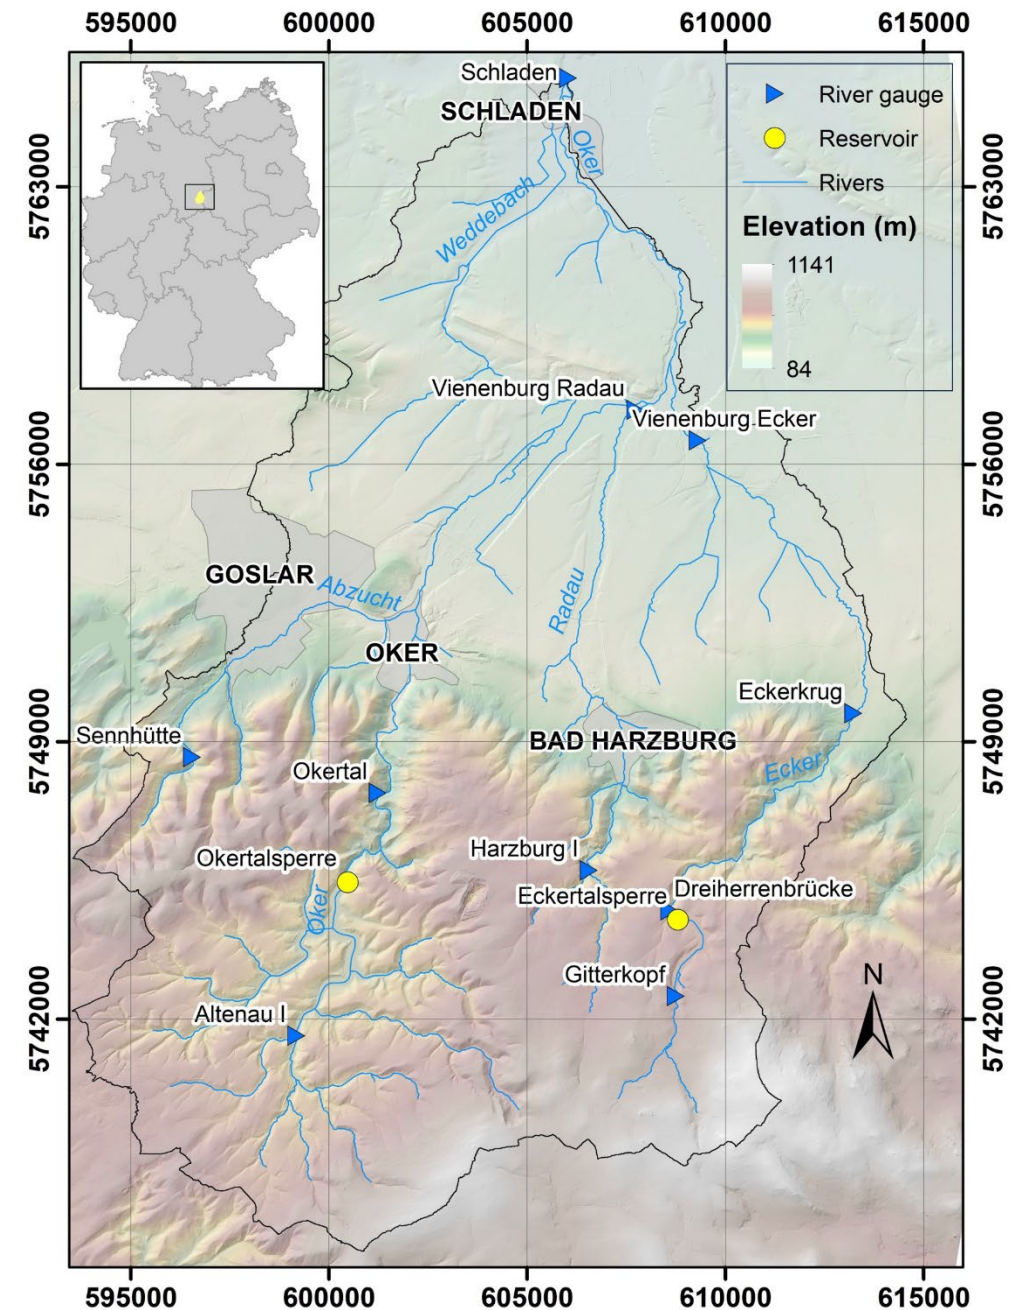

205 mm rainfall in 3 days

Source: https://www.goslarsche.de/lokales/goslar_artikel,-hochwasser-2017-als-die-flut-nach-goslar-kam-_arid,2587078.html

Study area

- Harz mountains, Germany
- Catchment of the Oker upstream of the gauge Schladen
- Area: 361.6 km²
- Elevation: 89 m – 1141 m
- 55% forest, 28% agriculture, 8% urban

Spatial input data

EXDIMUM

**DEM 1 m, upscaled to 5 m
+ Stream network NI**

Land use Corine (5 ha)

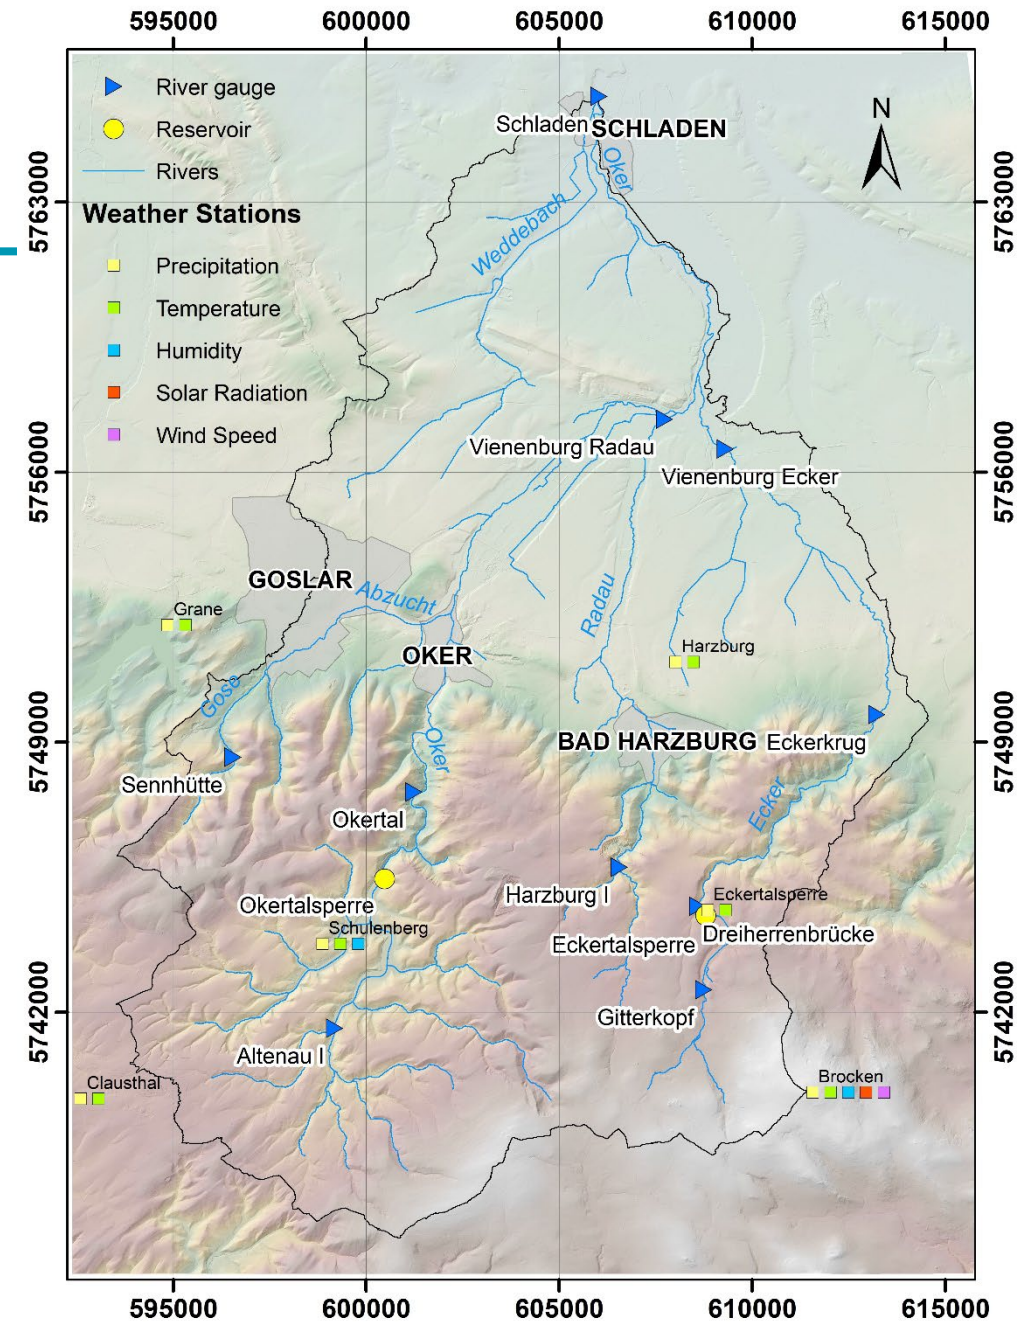

Soil map BÜK 200

Weather and river gauges

- 10 river gauges
- 6 rain and temperature gauges
- 2 humidity stations
- 1 solar radiation and wind speed gauge

Simulation period:

- 1 Jan. 2016 - 31 Dec. 2019

Calibration technique:

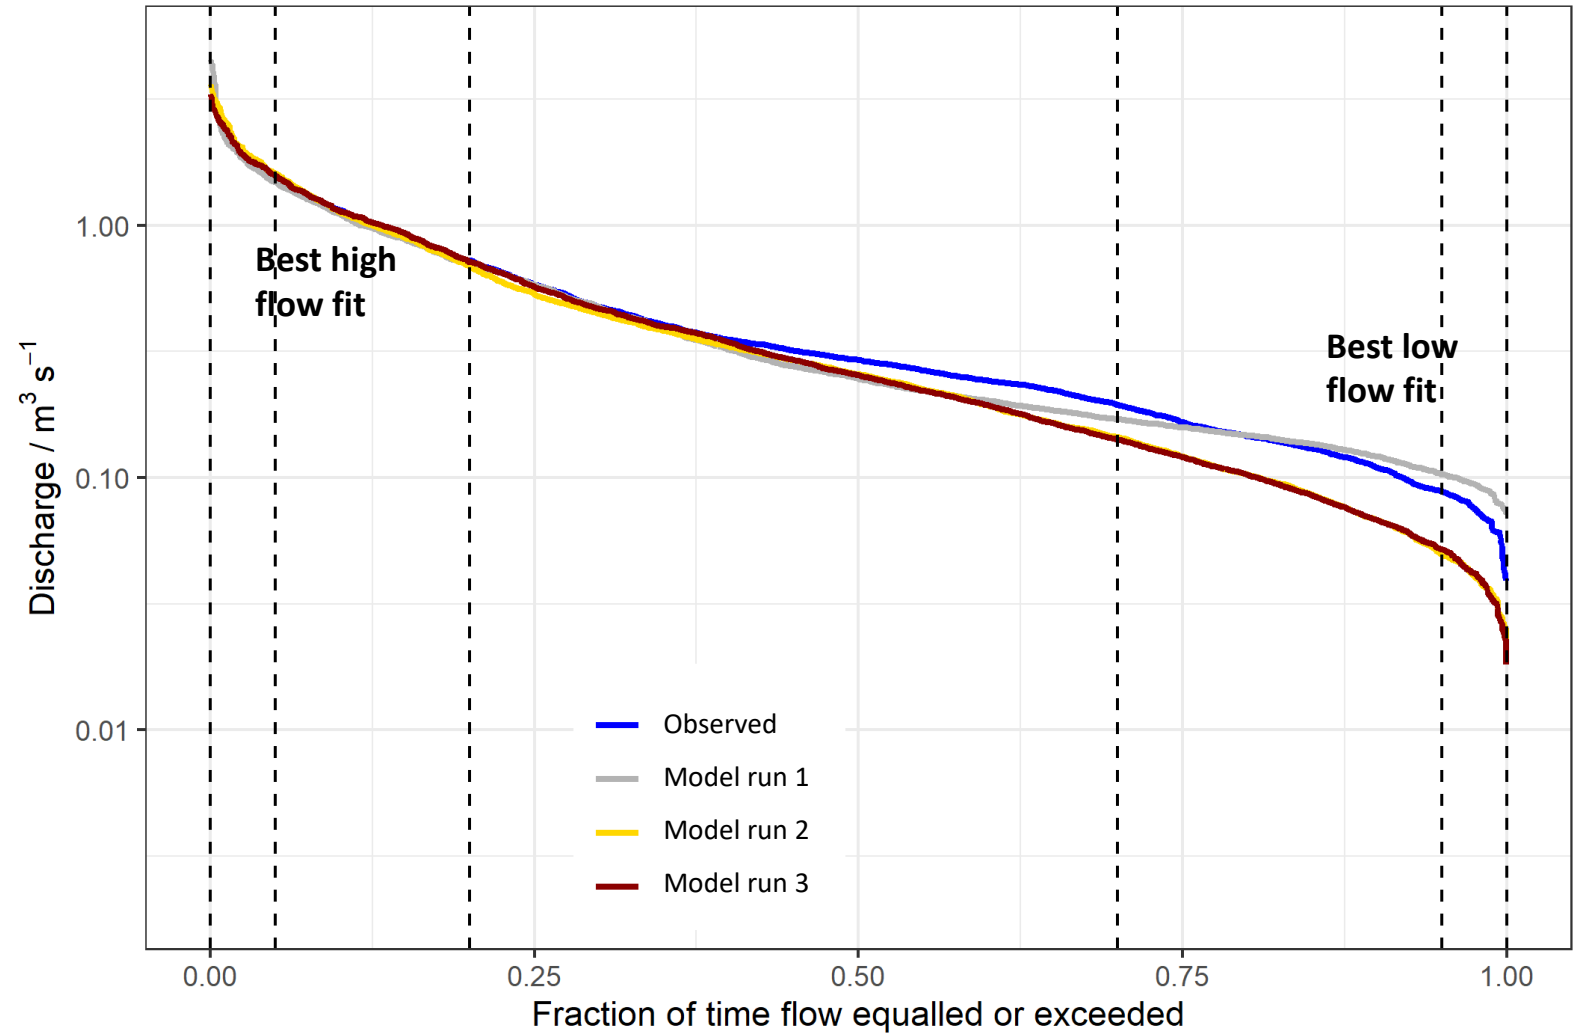

- Latin Hypercube Sampling to derive 200 parameter sets
- Best parameter sets selected:
 - Best Kling-Gupta efficiency
 - Best low flow model
 - Best high flow model

Best high flow and low flow models

- Based on the RSR* applied to the respective segment of the FDC

*ratio of the root mean square error to the standard deviation of measured data

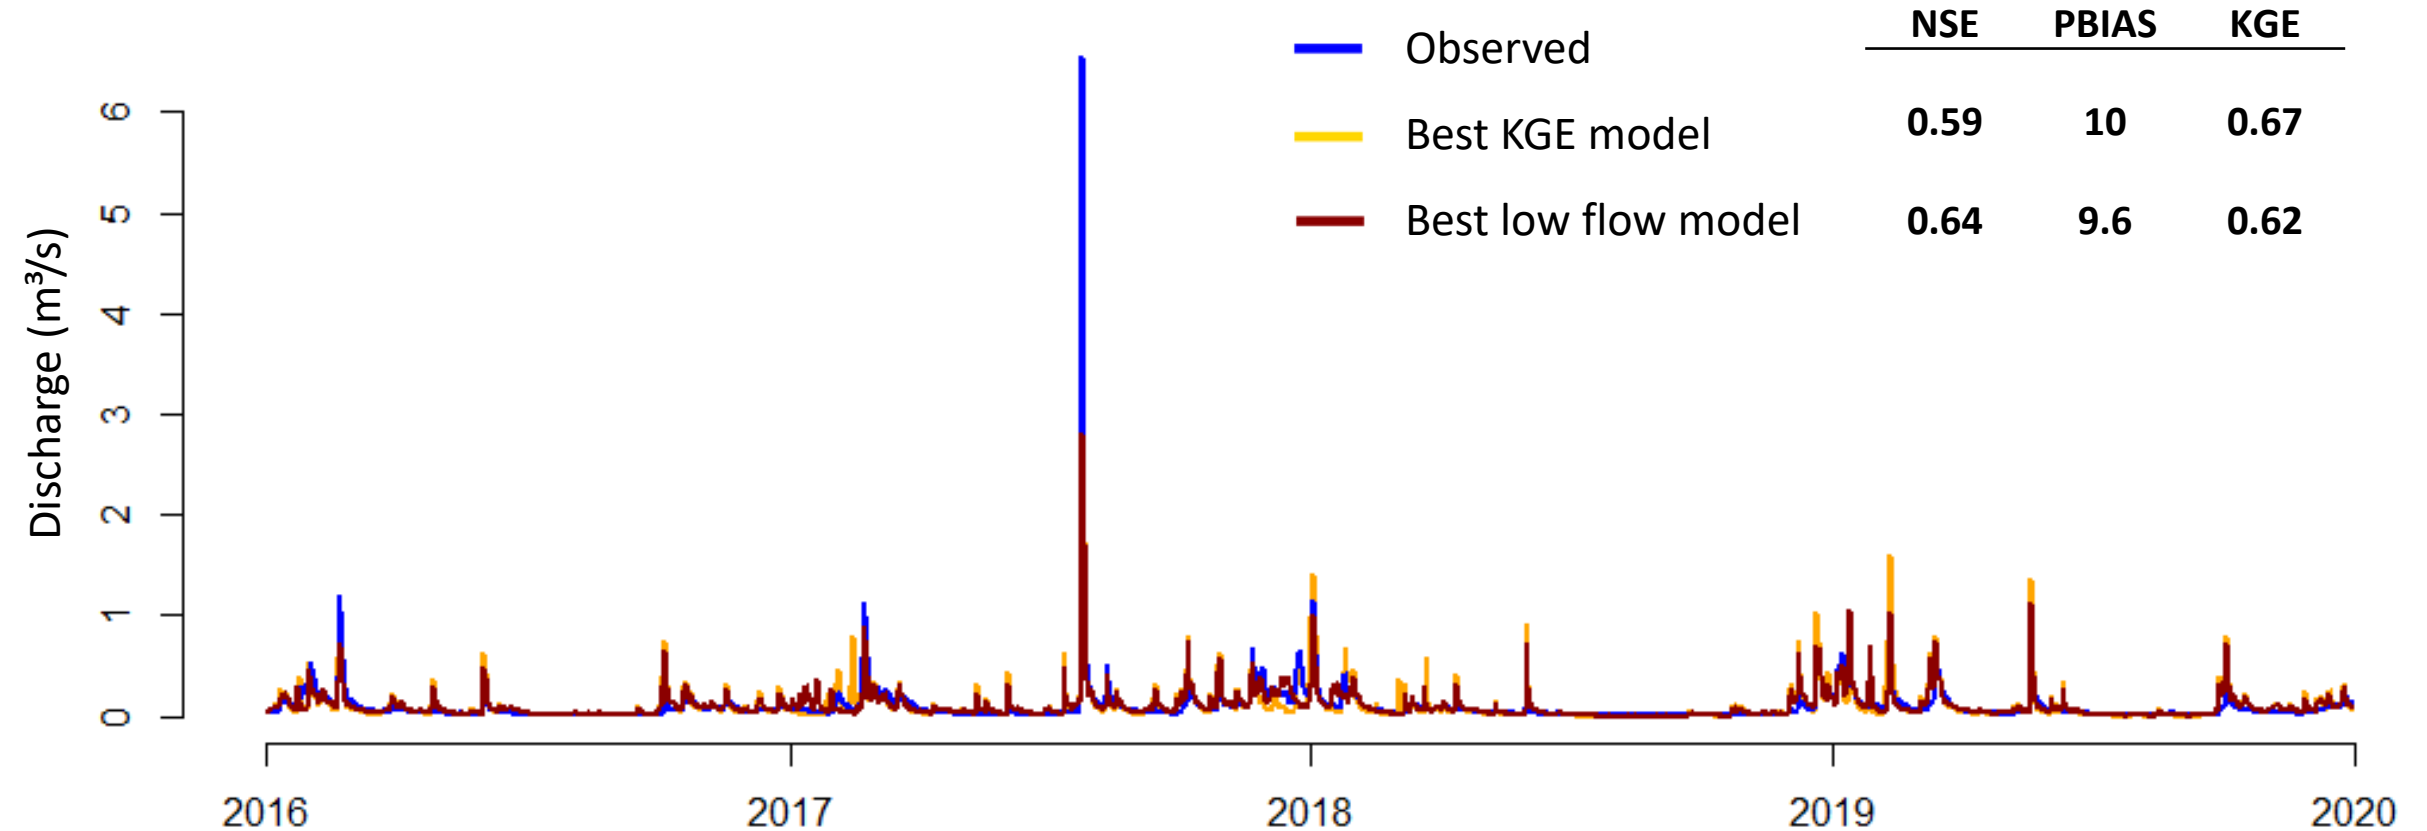

Overall model evaluation

Overall model evaluation

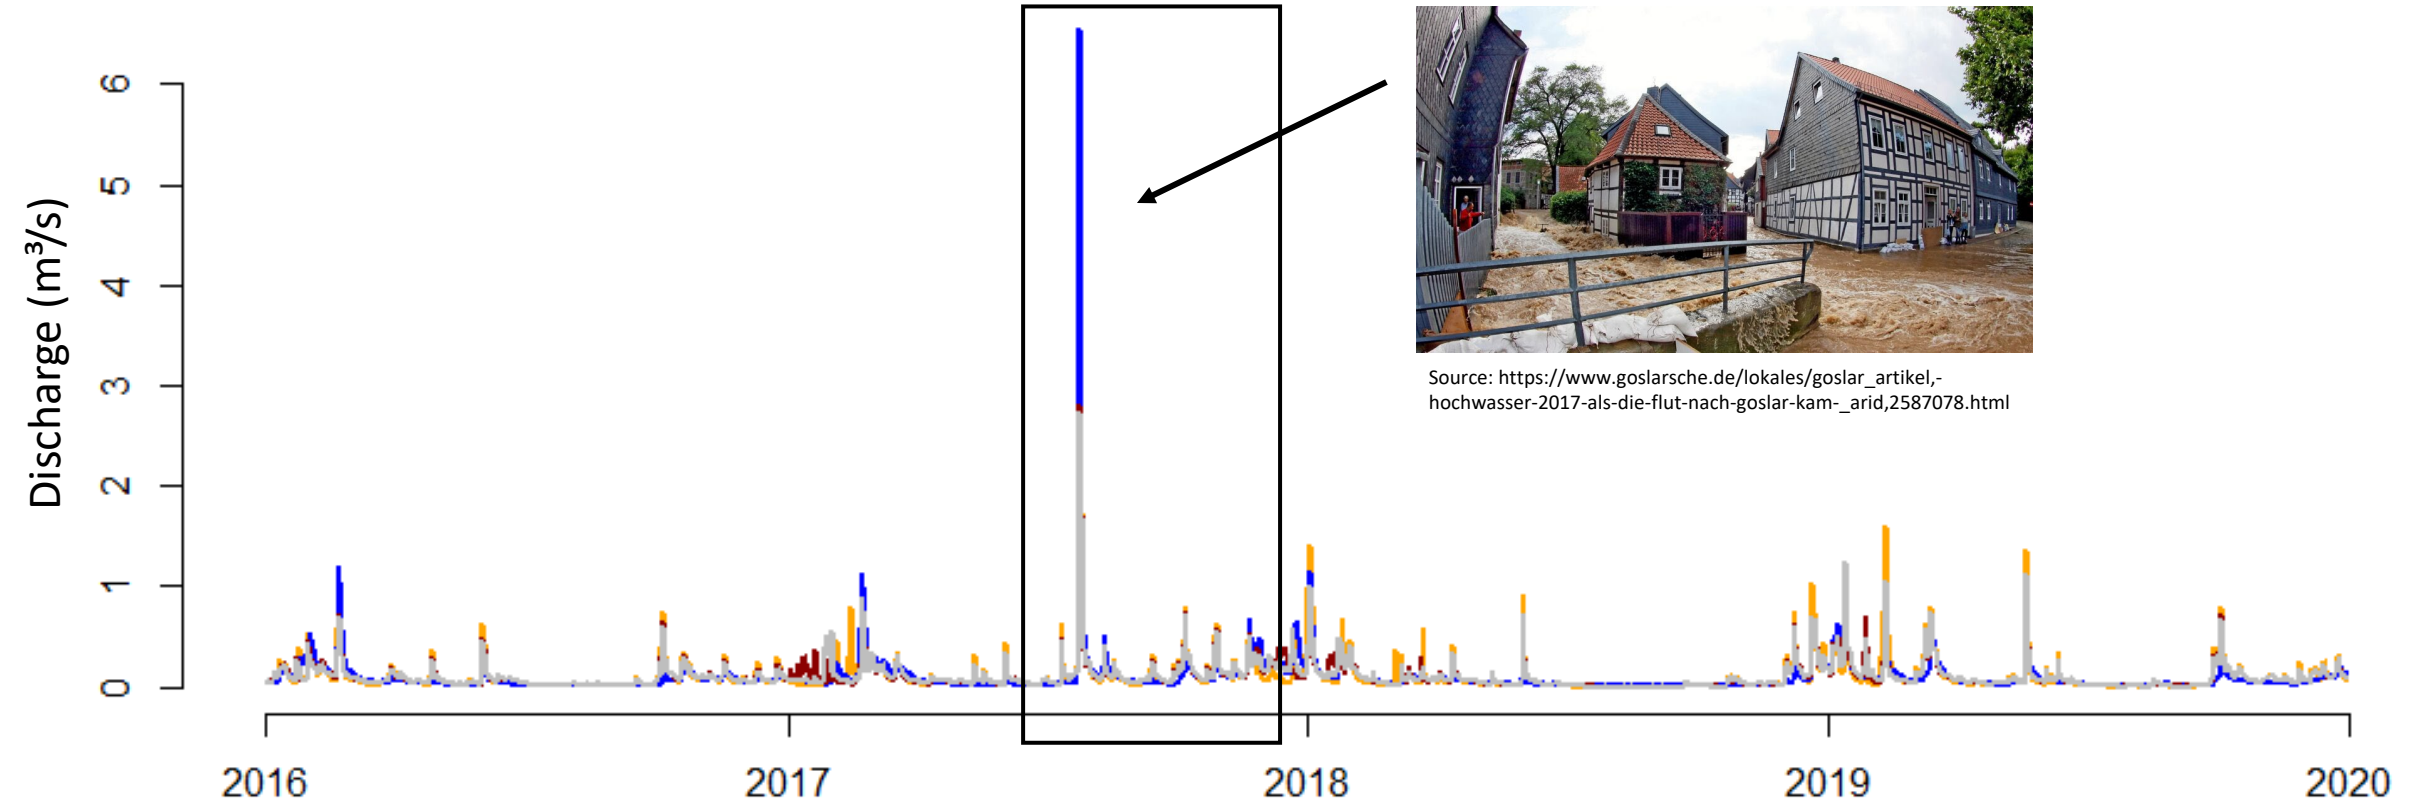

Overall model evaluation

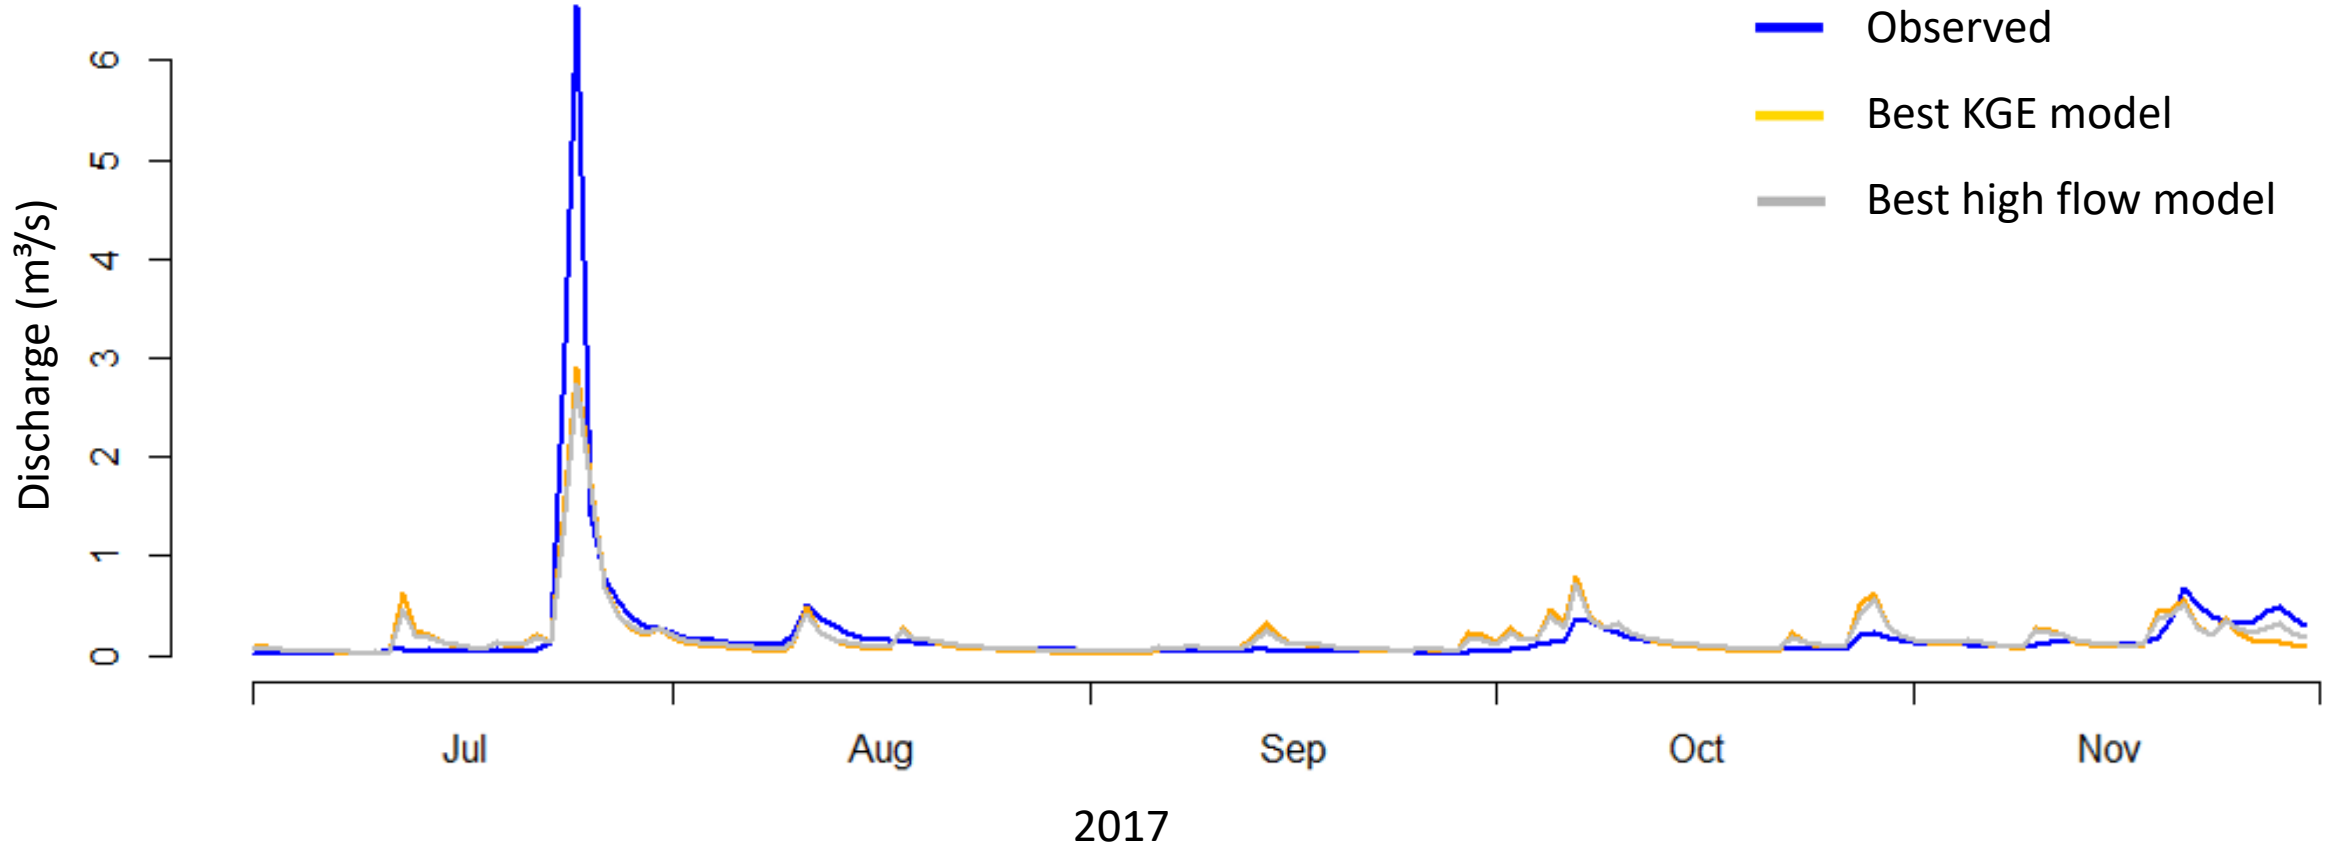

Evaluation of high flows: 2017

Evaluation of high flows: 2017

- Observed
- Best KGE model
- Best high flow model

Evaluation of low flows: 2018

Evaluation of low flows: 2018

Summary and Conclusion

- Similar performance of all ,best' models (diff. ≤ 0.06 in KGE and NSE)
- Extreme flood event 2017 not influenced by parameterization
- Uncertainty in the observation of the extreme flood peak
- Other peak flows better represented in high flow model
- Low flow model better than KGE model

- Preliminary results: small number of model runs

- Peak flows: Improve rainfall representation by spatial interpolation
- Low flows: Add a 2nd shallow groundwater layer
- More model runs:
 - more robust results
 - best model for high and low flows (?)
- Use remotely sensed ET or soil moisture to add plausibility

Thank you very much for your attention!
