## SWAT Community Tools

### [MapSWAT](#)

MapSWAT is an open-source QGIS plugin integrated with Google Earth Engine (GEE) that obtains and prepares SWAT+ input maps. It aims to help new or advanced users streamline the setup of their SWAT+ models. MapSWAT makes the preparation of SWAT+ input maps less error-prone, time-consuming and resource-intensive and facilitates model application in any study area worldwide. Additional information and the MapSWAT user manual and executable are available [online](#). View [reference paper](#).

### [SWAT-C](#)

SWAT-Carbon is a watershed scale model that converges terrestrial and aquatic carbon cycles at the watershed scale. It is based on the SWAT2012 and has unique functions to assess impacts that agricultural management and climate change have on a wide range of processes and indicators, such as soil organic carbon storage, nitrous oxides emissions, freeze-thaw cycles/water temperature, and riverine carbon fluxes.

### [R-SWAT](#)

Free, open source, graphical user interface for SWAT/SWAT+ calibration, parameter sensitivity/uncertainty analysis. For help see the [user group](#) and [tutorial videos](#).

### [SWAT+ Toolbox](#)

SWAT+ Toolbox is a user-friendly tool for SWAT+ model adaptations. Get the most recent version from the Additional Tools section of the SWAT+ page.

### [SWATrunR](#)

Integrate SWAT+ and SWAT2012 models in modeling workflows in R

### [SWATdoctR](#)

SWATdoctR is a collection of functions and routines for SWAT+ model diagnostics and calibration in R. The R package includes routines for a guided model calibration, functions for the evaluation of the model performance, as well as functions for the visualization and diagnosis of simulation outputs. For reference see [the original publication](#).

### APEX-CUTE

The Agricultural Policy Environmental eXtender - auto-Calibration and UncerTainty Estimator (APEX-CUTE) was developed to facilitate the calibration and uncertainty analysis routines with a user-friendly interface (Wang et al., 2014). APEX-CUTE was developed by the framework of the Integrated Parameter and Uncertainty Analysis Tool (IPEAT, Yen et al. (2014)) with the primary coding platform in Python. The current revision includes Sensitivity Analysis (SA) and the Dynamically Dimensioned Search (DDS) algorithm (Tolson and Shoemaker, 2007) for APEX auto-calibration. For the DDS optimization procedure, APEX-CUTE interacts with APEX by modifying APEX input files with candidate solution, running APEX, evaluating model output by calculating performance statistics, perturbing current best solution to generate candidate solution, and iteratively repeating the process until maximum number of objective function evaluations completed. APEX-CUTE offers sensitivity analysis using the Morris method (Morris, 1991; Campolongo et al., 2007). These SA and auto-calibration tools can be used to complement users' refinement of an APEX model. Users are responsible for conducting necessary checks for model input and initial runs before conducting SA and/or auto-calibration using APEX-CUTE to make sure that the basic APEX input and setup are correct. More applications of APEX-CUTE can also be found in Wang et al. (2015).

This repository contains source codes and an executable for APEX-CUTE.

**NOTHING GOOD**

*Please don't  
take this too  
literally!*

**HAPPENS IN EXCEL...!**

# Creating a workflow: Automate everything

Be realistic! You will do things over and over again...

Manual steps are...

- error prone
- time consuming
- not documented

Every command or click should be stored in a way, such that it can be executed again!

But you can automate all steps!

# Make things more usable - for yourself and others!

Reproducibility in practice:

How easily can somebody use the thing later?

Think about your target audience to set priorities! Do they want to ...

re-run all your scripts?

run the code as piece of software?

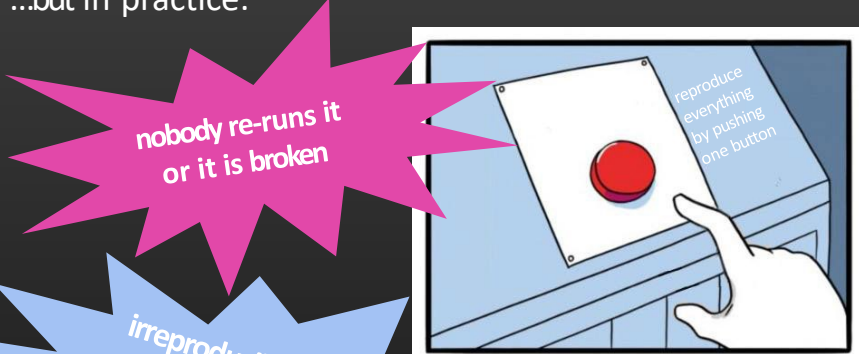

use the code and adapt it?

use the computation results only?

understand what and how we did it?

# Our goal: reproducibility!

...but in practice:

traceability

comprehensibility

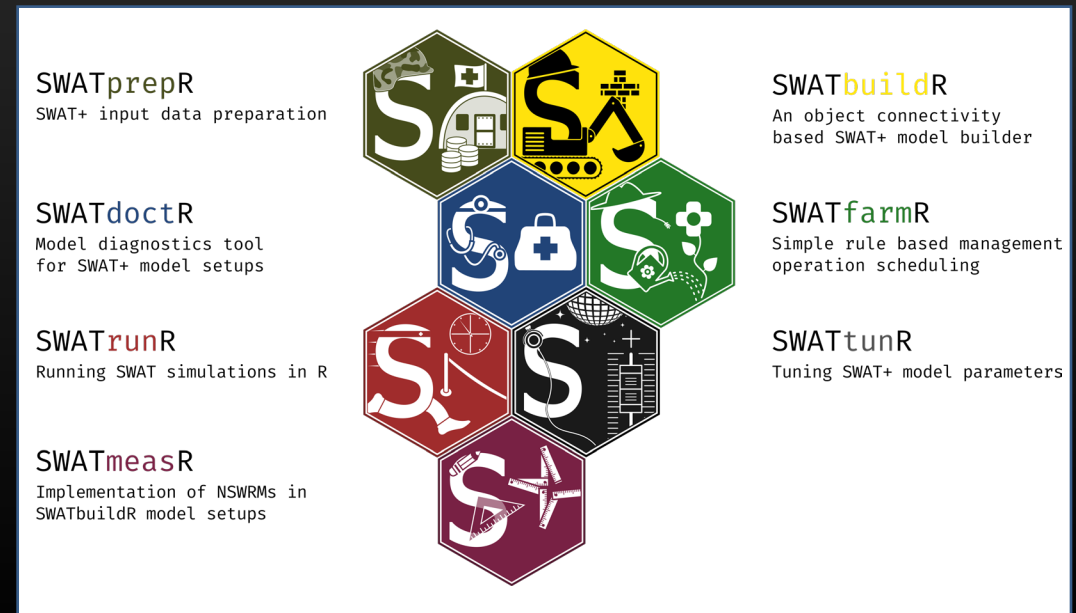

some users might be interested mostly in results

# How easily can somebody use the thing later?

R6 object-oriented programming for R: step-by-step APEX model setup.

Inherent or have functions adapt from:

- sensobol
- apexsensun
- SWATdoctR
- SWATrunR
- SWATfarmR

# How easily can somebody use the thing later?

Create and Load TxtInOut Files:

```
load_apex_files: function (project_path)
```

```
setup_apex_folder: function (project_path = project_path, run_path = NULL)
```

# How easily can somebody use the thing later?

## Updated Functions:

update\_APEXRUN: function (ASTN = NULL, ISIT = NULL, IWPN = NULL, ISUB = NULL, ...)

update\_SUBAREA: function (INPS = NULL, IOPS = NULL, IWTH = NULL, LUNS = NULL, ...)

update\_APEXCONT: function (NBYR = NULL, IYR = NULL, NGN = NULL, IET = NULL, IPRK = NULL, ...)

update\_PARM: function (parm.tbl)

update\_PRNT: function (output\_ext = NULL, over\_write\_PRNT = TRUE, save\_output = FALSE)

# How easily can somebody use the thing later?

Sensitive Analysis and CC change data:

```
create_sample_matrices: function (params, gsa_method = list(method =  
"SENSOBOL", arguments = list(...))
```

```
set_cc_projections: function (ccfile = NULL, update_OPC = FALSE, mgtrulefile  
= NULL)
```

gsa\_methods supported: MORRIS, LHS, SENSOBOL, FAST99

# How easily can somebody use the thing later?

RunAPEX: function (input = list(run\_path = file.path(self\$run\_path, "TxtInOut"))

- Standardized input and output management
- Scalability with parallel simulations

Re-running computations might be difficult or take long time... Keep old versions!

- Integration with SQL for long-term storage and analysis
