*University of Strasbourg, France*

# Study Area

## Lauter Catchment Description

|                           |  |
|---------------------------|--|
| Area:                     | 375.8 km <sup>2</sup>  |
| Elevation range:          | 107-609.3 m  |
| Length of the mainstream: | 74.6 km  |
| Slope of the mainstream:  | 0.25%  |
| Discharge (MQ):           | 2.31 m <sup>3</sup> /s<br>(Bobenthal, 1956-2023)   |
|                           | 3.27 m <sup>3</sup> /s<br>(Salmbacher Passage, 1961-2021)  |
| Particularities:          | <ul style="list-style-type: none"> <li>- Sandstone mitigating both high water peaks and low flow periods</li> <li>- Historical wood-rafting pond series</li> </ul> |

## Overview of the project

Klimawandel- und  
Landnutzungszenarien

Scenarios de  
changement climatique  
et d'utilisation des sols

Artenvielfalt und  
Rückzugsgebiete

Diversité des  
espèces et zones  
réfuges

Wasserquantität  
und -qualität

Quantité et qualité  
de l'eau

Vernetzung, Umsetzung

Dialogue scientifique,  
mise en réseau, mise  
en œuvre

# Study Area

## Historical management

- how the ancient wood-rafting ponds influence the hydro-regime

## Protection zone

- how pristine zones react to climate change

## Urban area

### Quantity

- how urban area reacts to climate change
- water extraction
- hydro-stations

### Quality

- urban runoff
- point source pollution

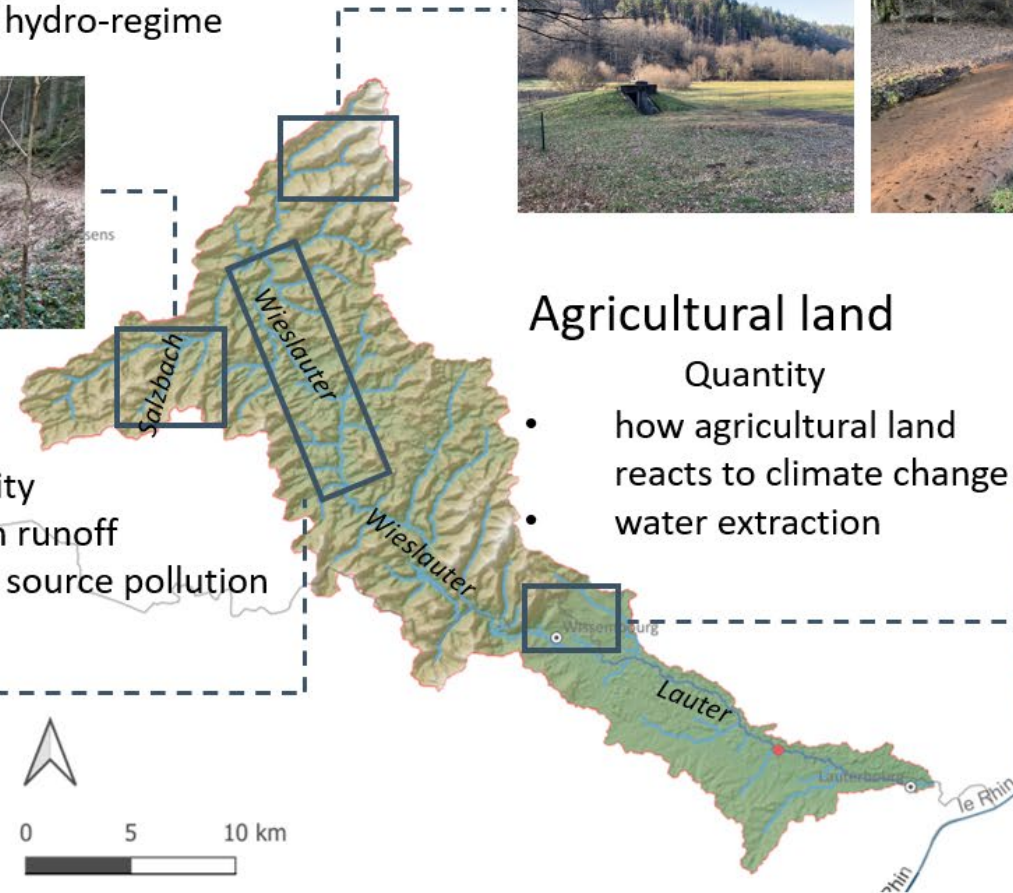

## Agricultural land

### Quantity

- how agricultural land reacts to climate change
- water extraction

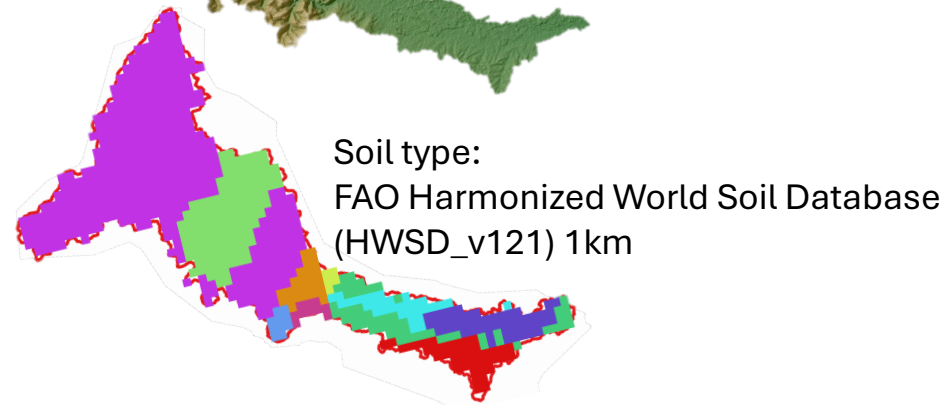

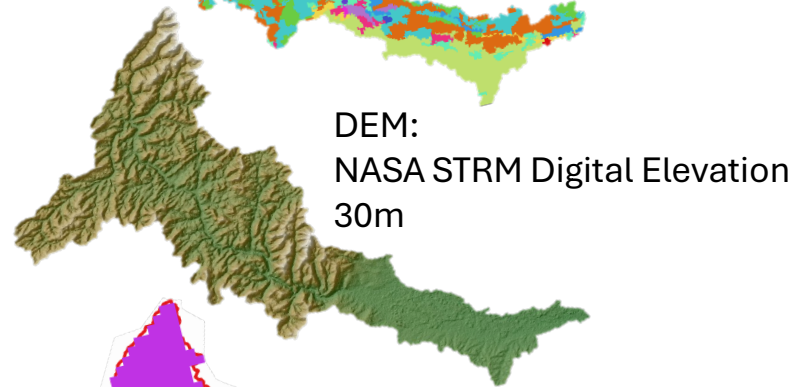

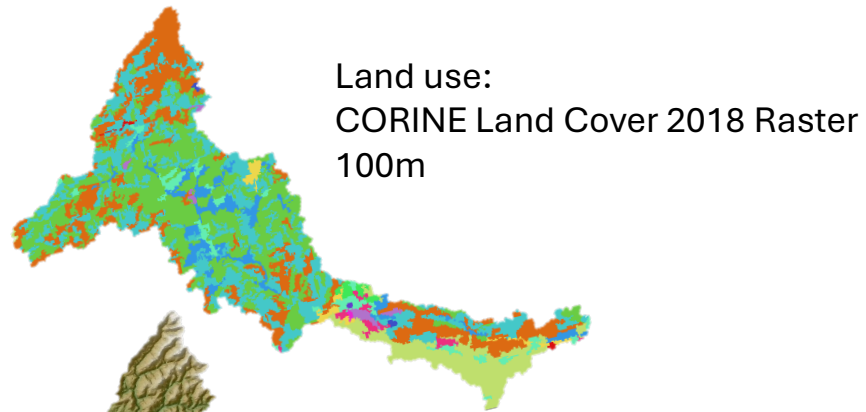

### Quality

- non-point source pollution

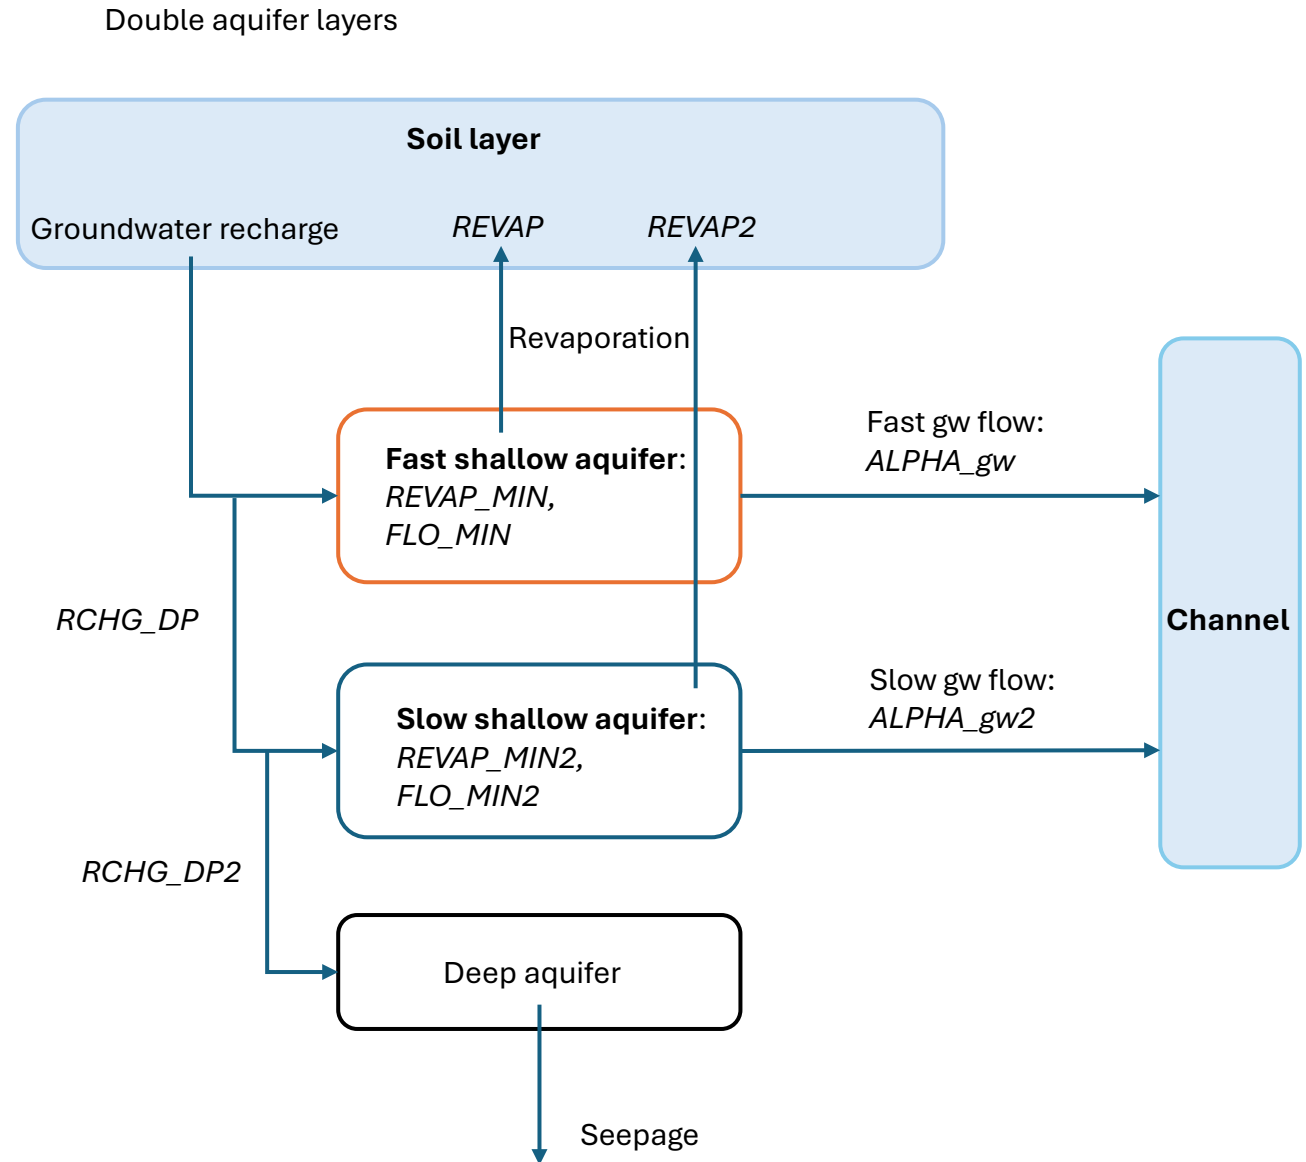

# SWAT Model

Climate data:  
CLIMATE COMPETENCE CENTRE of Rhineland-Palatinate  
based on DWD data, in a 1000 m by 1000 m resolution

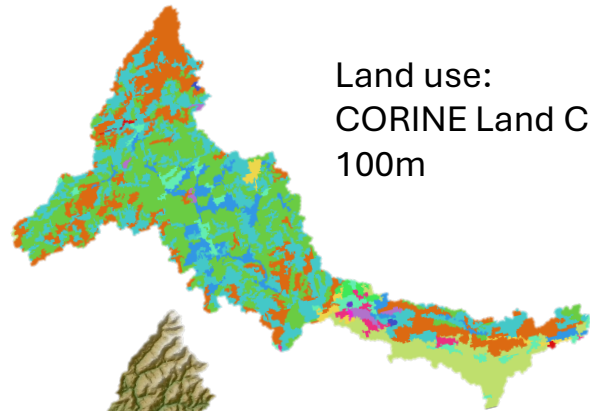

Great appreciation to everyone of the group of  
Dept. of Hydrology and Water Resources  
Management of University of Kiel for all the helps!

## Aquifer parameters

### - Shallow aquifer

| Parameter | Value |
|-----------|-------|
| alpha_bf  | 0.9   |
| revap     | 0.02  |
| rchg_dp   | 0.8   |
| flo_min   | 0.5   |
| revap_min | 5     |

### - Deep aquifer

| Parameter | Value |
|-----------|-------|
| alpha_bf  | 0.1   |
| revap     | 0.02  |
| rchg_dp   | 0.05  |
| flo_min   | 8     |
| revap_min | 10    |

## Other parameters

### - Upstream

| Parameter | Change | Value   |
|-----------|--------|---------|
| cn2       | pctchg | -16.291 |
| cn3_swf   | absval | 0.999   |
| lat_ttime | absval | 179.983 |
| lat_len   | absval | 62.237  |
| perco     | absval | 0.267   |
| esco      | absval | 0.971   |
| epco      | absval | 0.109   |
| surlag    | absval | 7.418   |
| canmx     | pctchg | 8.401   |
| latq_co   | absval | 0.335   |
| awc       | absval | 0.012   |
| slope     | pctchg | -10.467 |
| z         | pctchg | 5.354   |
| k         | pctchg | -17.814 |

### - Downstream

| Parameter | Change | Value   |
|-----------|--------|---------|
| cn2       | pctchg | -14.545 |
| cn3_swf   | absval | 0.998   |
| lat_ttime | absval | 1.340   |
| lat_len   | absval | 4.451   |
| perco     | absval | 0.009   |
| esco      | absval | 0.043   |
| epco      | absval | 0.993   |
| surlag    | absval | 0.101   |
| canmx     | pctchg | -2.429  |
| latq_co   | absval | 0.740   |
| awc       | absval | 0.016   |
| slope     | pctchg | 2.321   |
| z         | pctchg | -19.876 |
| k         | pctchg | -45.329 |

# Results

— Observed — Model

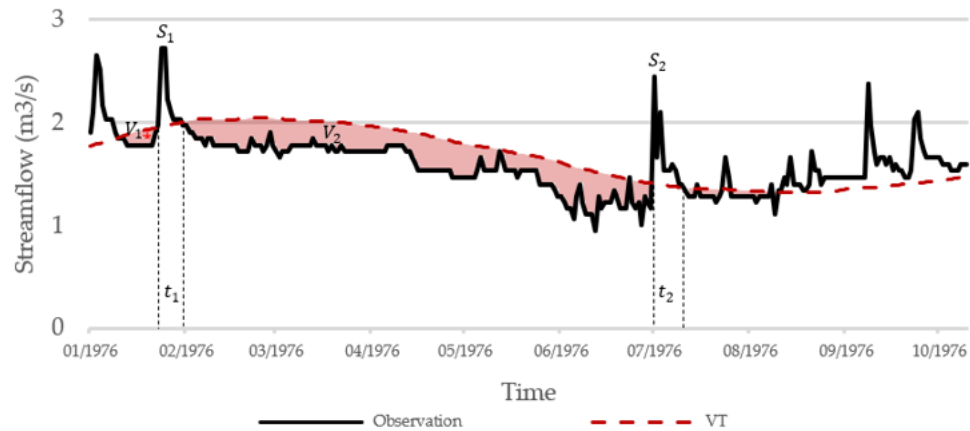

# Discussion

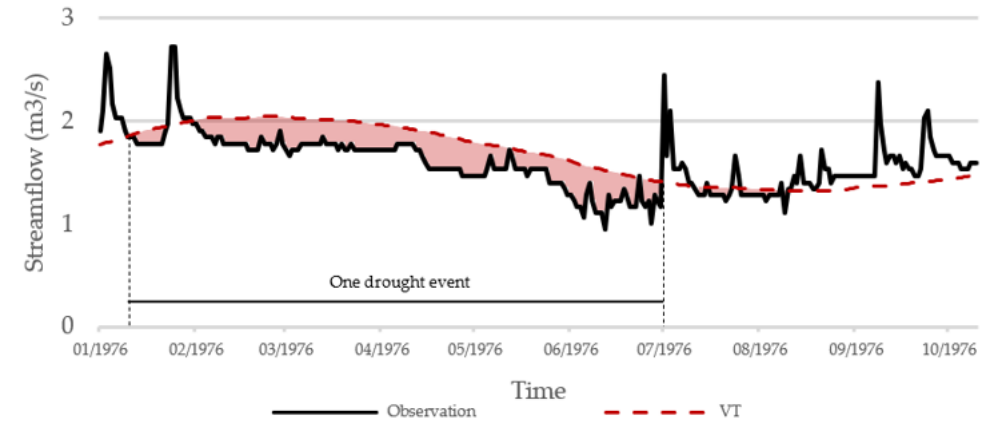

Questions to answer:

- Differences of the drought period characteristics between upstream and downstream
- How hydrological drought propagates from upstream to downstream

Hydrological drought period definition:

if  $t_i < 20$  days and  
 $p_i = S_i/V_i < 0.25$

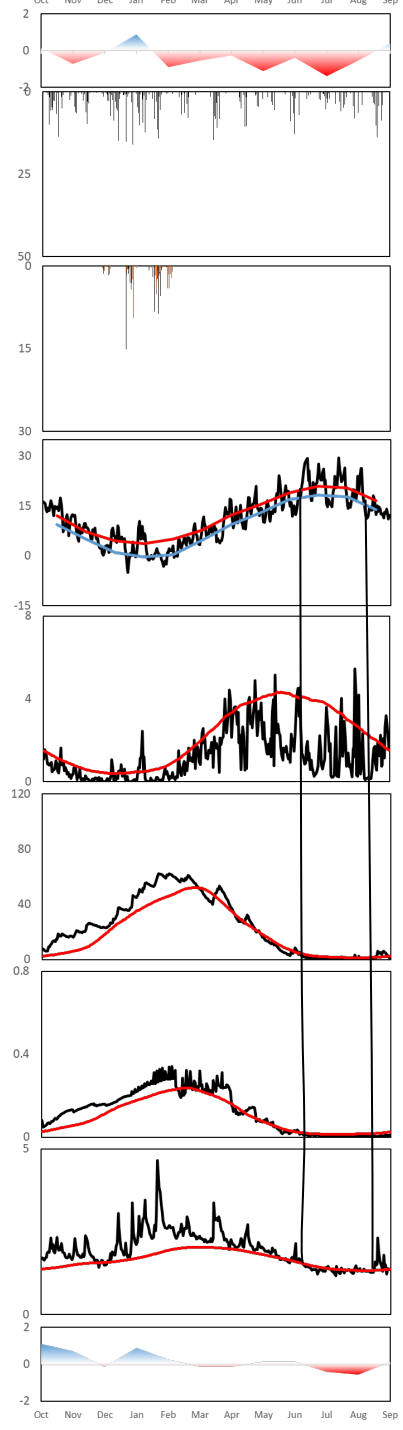

# Drought type

Low precipitation

Low temperature

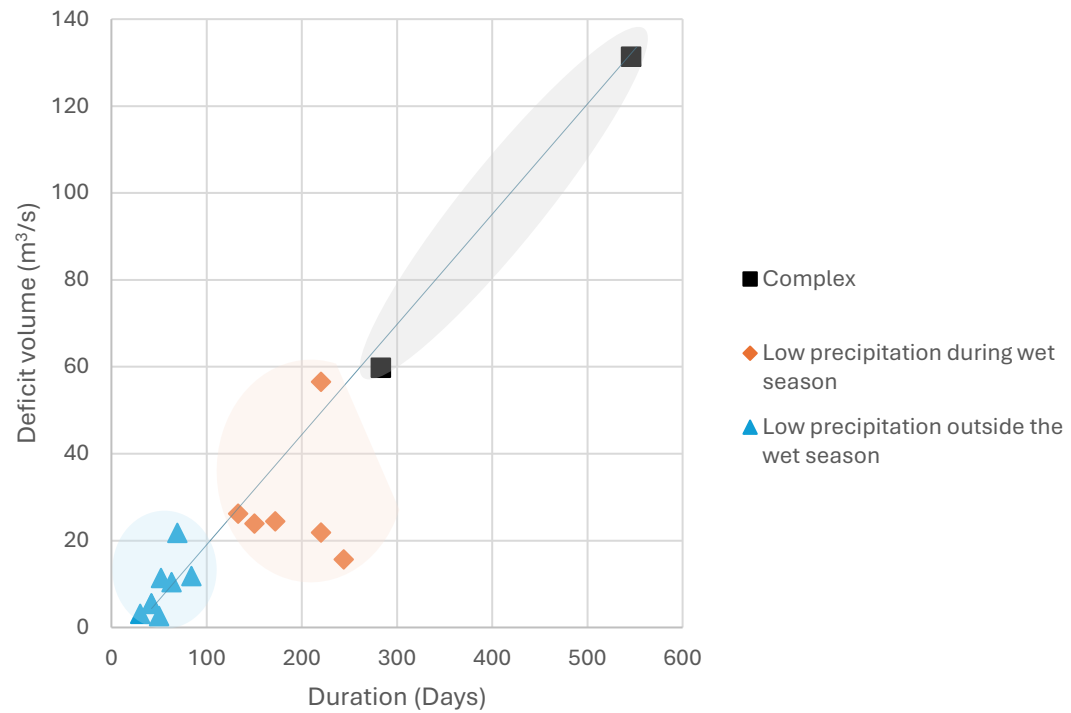

High temperature

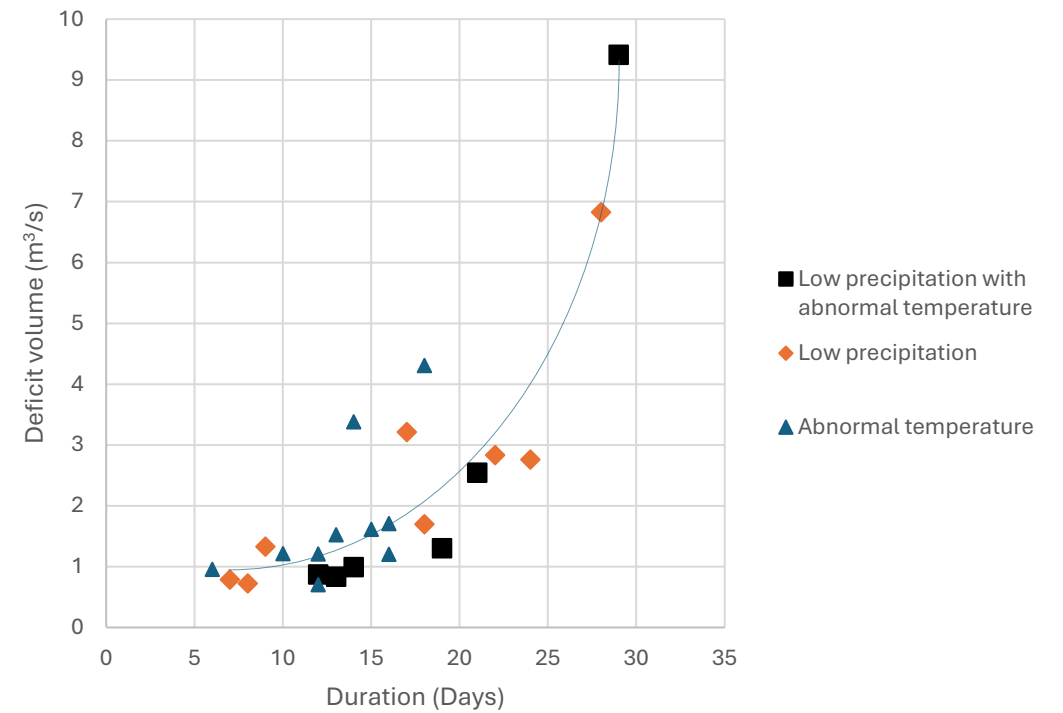

# Characteristics of each drought type from upstream to downstream

## Bobenthal Station (Upstream)

a) Drought period longer than 30 days

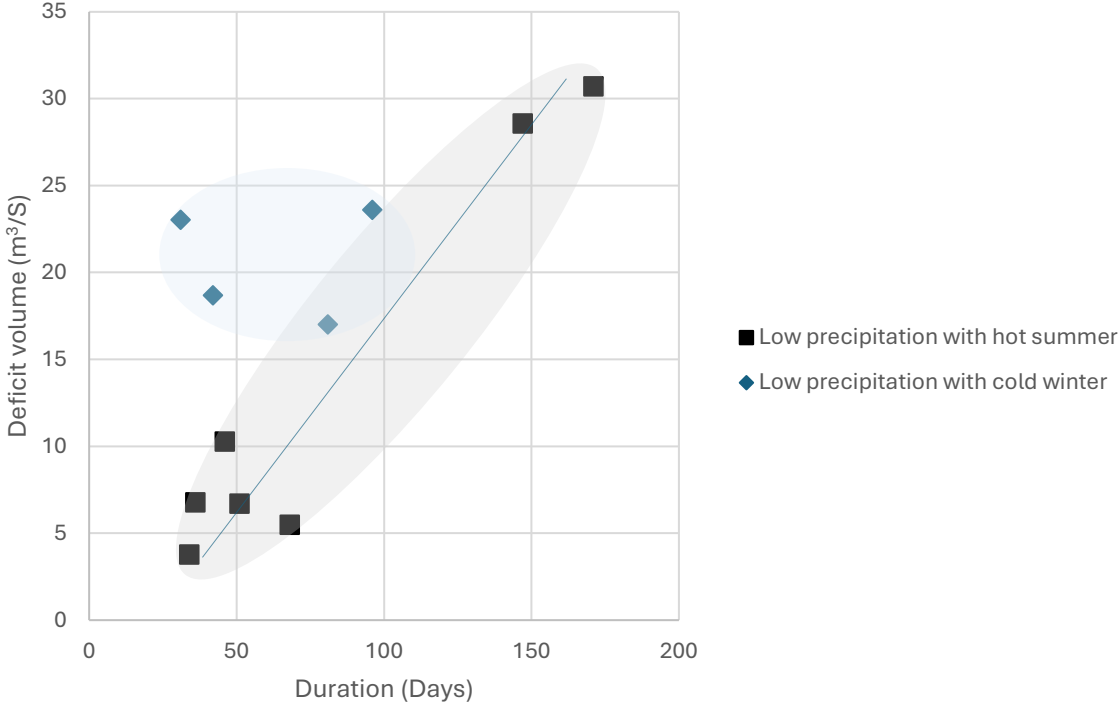

b) Drought period shorter than 30 days

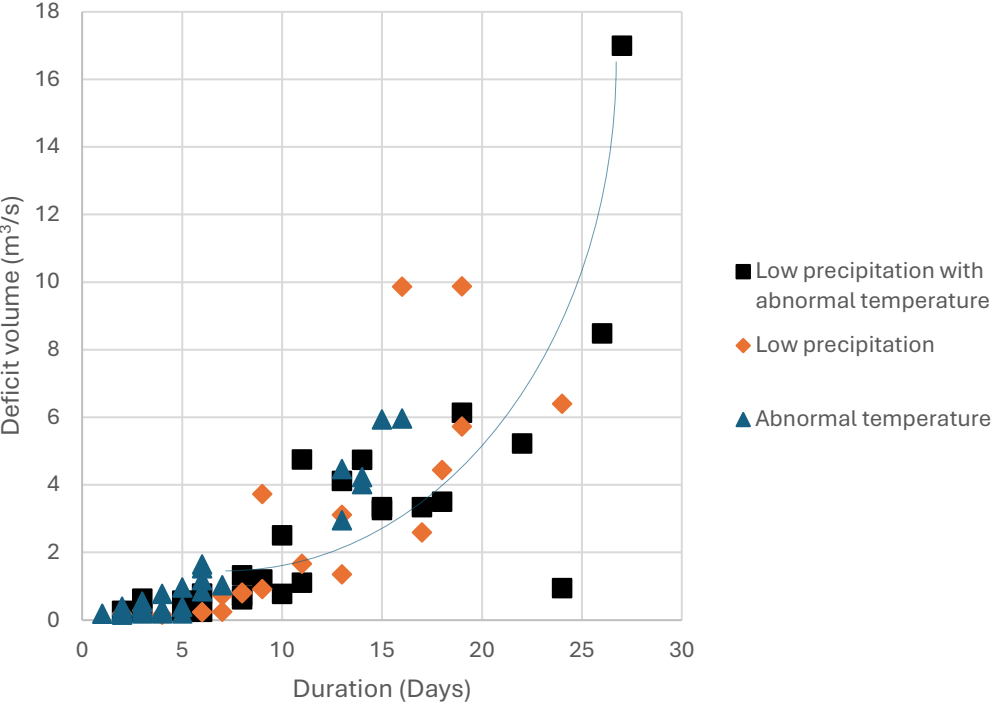

# Characteristics of each drought type from upstream to downstream

## Salmbacher Passage Station (Downstream)

a) Drought period longer than 30 days

b) Drought period shorter than 30 days

# How hydrological drought propagates

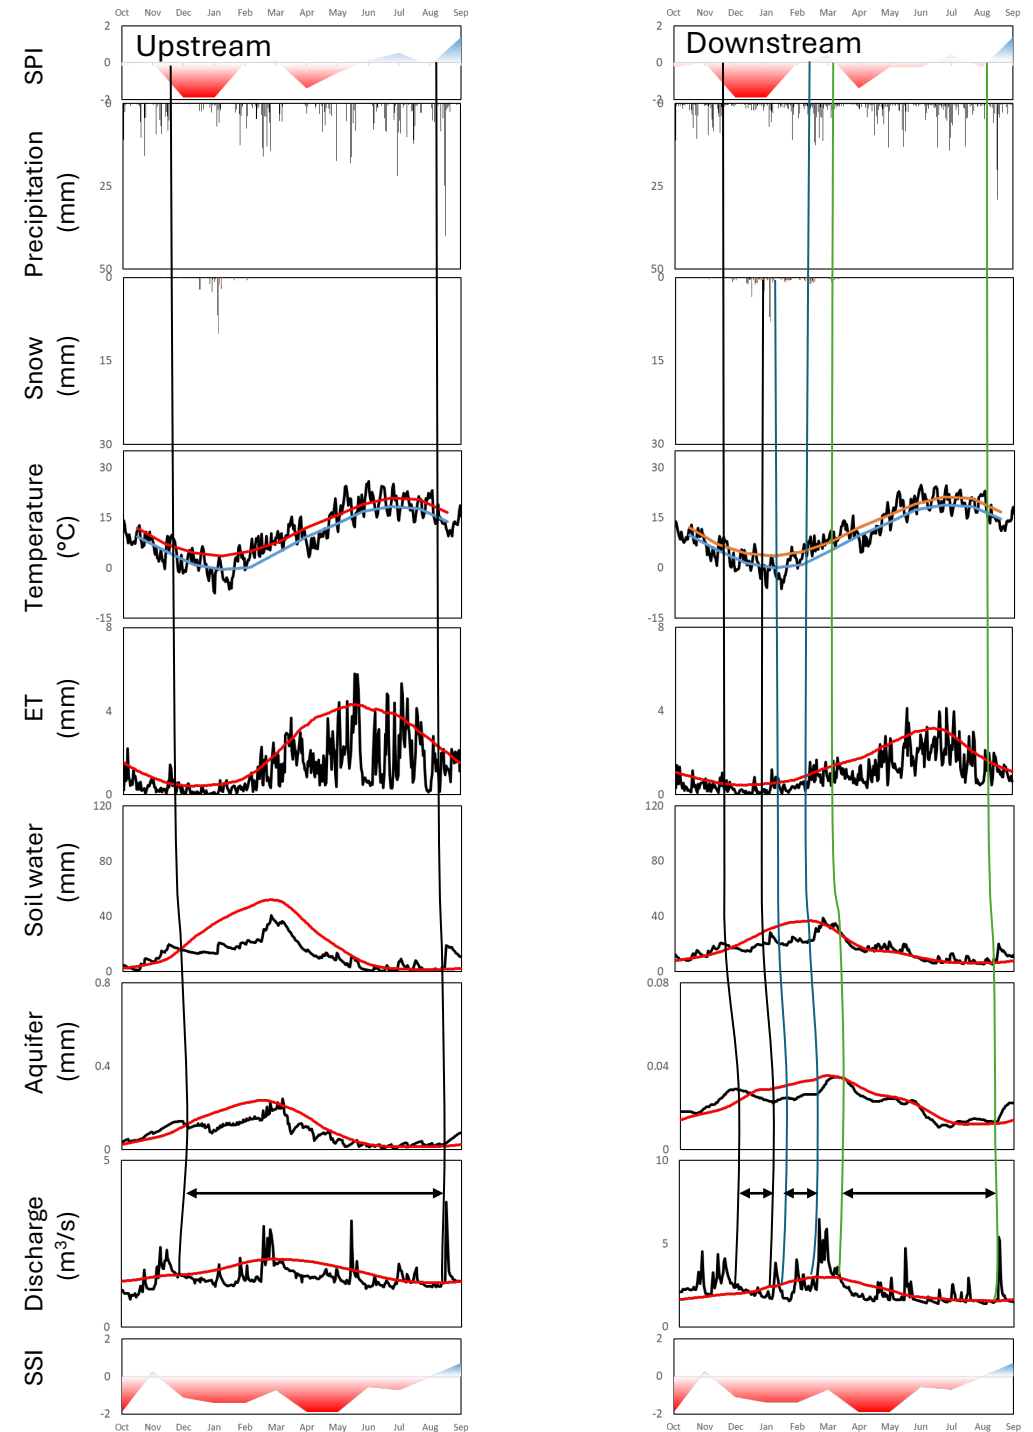

## Hydrological drought events in the water year 2017

### - Bobenthal station

| No. | Start date | End date   | Duration |
|-----|------------|------------|----------|
| 1   | 2016-12-03 | 2017-09-12 | 283 days |

### - Salmbacher Passage station

| No. | Start date | End date   | Duration |
|-----|------------|------------|----------|
| 1   | 2016-12-16 | 2017-01-11 | 26 days  |
| 2   | 2017-01-16 | 2017-02-27 | 42 days  |
| 3   | 2017-03-24 | 2017-09-11 | 171 days |

# How hydrological drought propagates

## Hydrological drought events in the water year 2017

- Hydrological drought period began around **2 weeks later at downstream than upstream**
- Highly active **surface water and groundwater exchange** at upstream and **higher ET** make upstream more prone to precipitation deficit, which resulted in **longer hydrological drought period** and **slower recovery** than downstream
- Order for each component revealed drought signal:
  - 1) Upstream, soil water -> discharge -> aquifer
  - 2) Downstream, soil water -> aquifer -> discharge

Thank you for your attentions!
