# **Assessment of switchgrass implementation in Pinios River Basin in Thessaly, Greece**

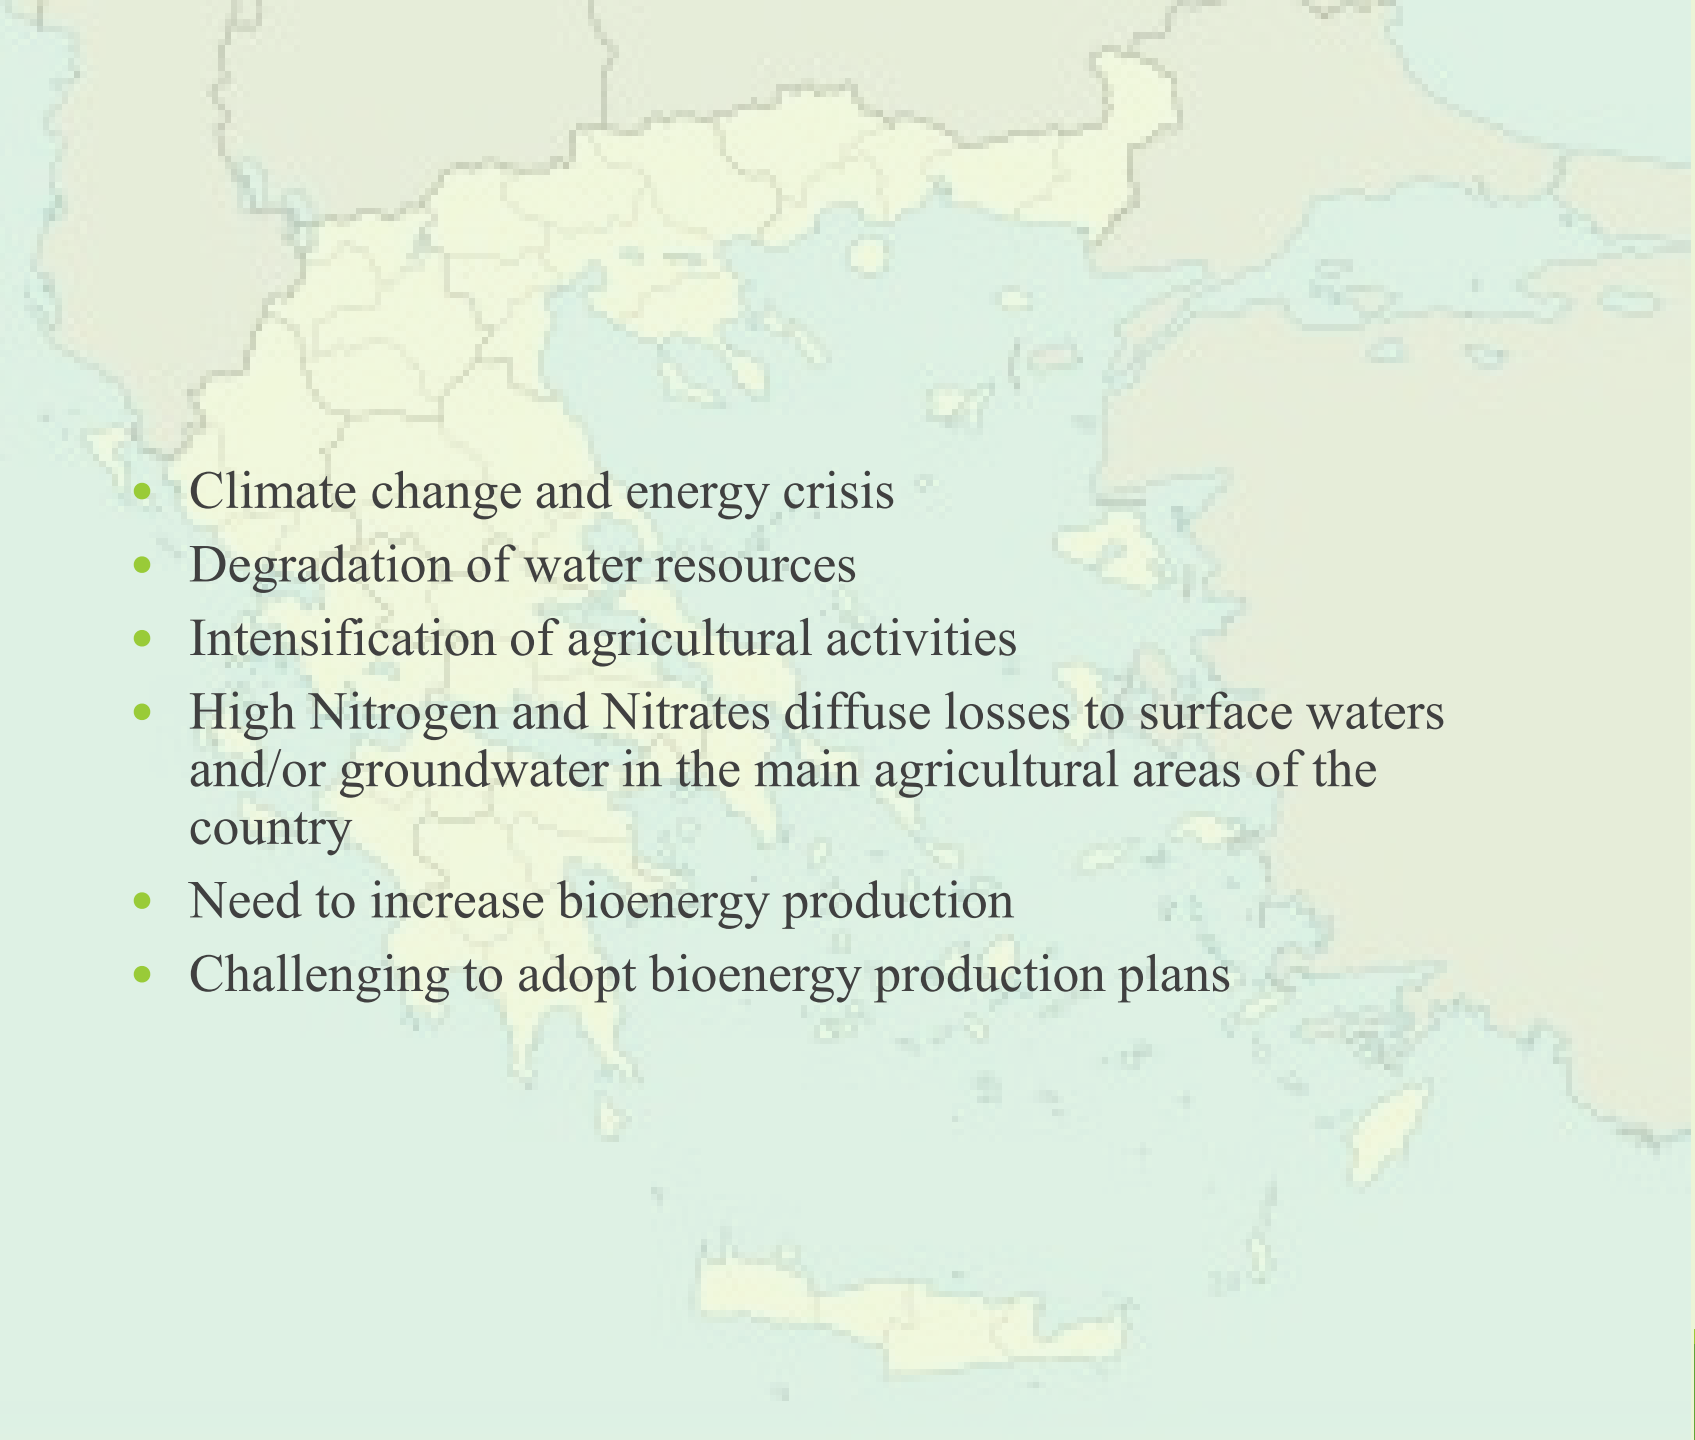

---

MARIA SISMANIDI, LAMPRINI KOKKINAKI, APOSTOLOS VYZIOTIS, SOFIA KAVALIERATOU,  
CHARALAMPROS GEORGOUSIS, KYRIAKOS GIANNOULIS, DIMITRIOS KARPOUZOS, PANTAZIS  
GEORGIU, YIANNIS PANAGOPOULOS

**SWAT Conference**  
**10-12 July 2024**

# Key issues in Greece

- Climate change and energy crisis
- Degradation of water resources
- Intensification of agricultural activities
- High Nitrogen and Nitrates diffuse losses to surface waters and/or groundwater in the main agricultural areas of the country
- Need to increase bioenergy production
- Challenging to adopt bioenergy production plans

# The Biograss project

**BIOGRASS**  
sustainable energy future

A few words for the project :

- ✓ Period of implementation : Oct. 2023 – Oct. 2025
- ✓ Coordinator: Aristotle University of Thessaloniki
- ✓ Funded by the European Union (Next Generation EU)
- ✓ A pilot example towards energy security in Greece based on the perennial crop Switchgrass
- ✓ Implemented in Pinios river basin, Thessaly

# Switchgrass

- **Perennial crop**
- **High efficiency in biomass production**
- **Resource-efficient**
- **Low-input**
- **Conventional tillage equipment**
- **Erosion protection**
- **Nitrate reduction**

# Pinios river basin

The most important agricultural producer in Greece

Area: 10600 km<sup>2</sup>

Agricultural area: 4000 km<sup>2</sup>

Main cultivated crops: cotton, wheat, corn, alfalfa

Overexploitation of surface and groundwater

A nitrate vulnerable zone

# Objectives of the study

---

Implementation of the SWAT model in the Pinios river basin in order to:

- Explore 4 initial switchgrass implementation scenarios
- Identify the ideal one out of them for the study area
- Improve water quality with respect to N pollution
- Produce sufficient amount of biomass

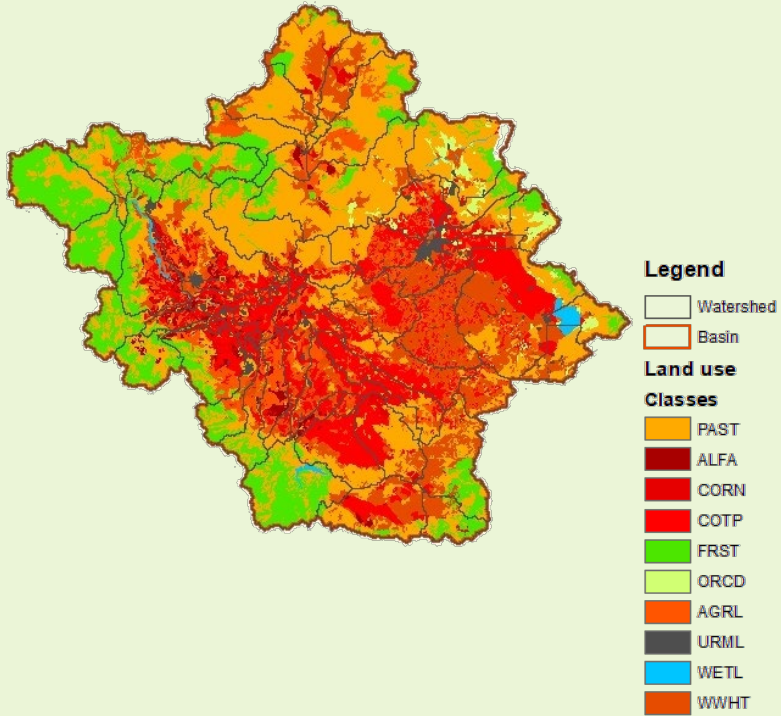

# SWAT model – Soil Water Assessment Tool

---

## *WHY SWAT?*

- ❑ Process-based (management practices – crop growth simulation)
- ❑ Distributed (Hydrologic Response Units - HRUs: The combinations of unique land use and soil types)
- ❑ Long-term impacts of pollutants
- ❑ Developed for use in agricultural catchments

Slope map

Soil map

Model inputs

# Pinios basin modelling with SWAT

- 61 subbasins
- 1837 HRUs
- The area of the basin : 10622 Km<sup>2</sup>
- The Cropland area : 452471 Ha
- Weather data for 16 years (1977-1993) and for 8 years (2016-2023)
- Mean annual precipitation : 700mm
- 3 reservoirs in the catchment
- Outside source: Plastira
- Operation schedules for the main crops

# Flows calibration

Calibration for flows was carried out :

- At 2 sites (Amigdalia and Ali-Efenti)
- In monthly basis
- With the use of 16 years (1977-1993) of available flow data
- Evaluation of the results using Nash-Sutcliffe-statistical indexes

Nash-Sutcliffe	R <sup>2</sup>
0,8	0,9

# Flows validation

Validation for flows was carried out :

- At 2 sites (Tempi and Nomi)
- In monthly basis
- With the use of 5 years (2019-2023) of available flow data
- Evaluation of the results using Nash-Sutcliffe-statistical indexes

Nash-Sutcliffe	R <sup>2</sup>
0,7	0,8

# N Calibration

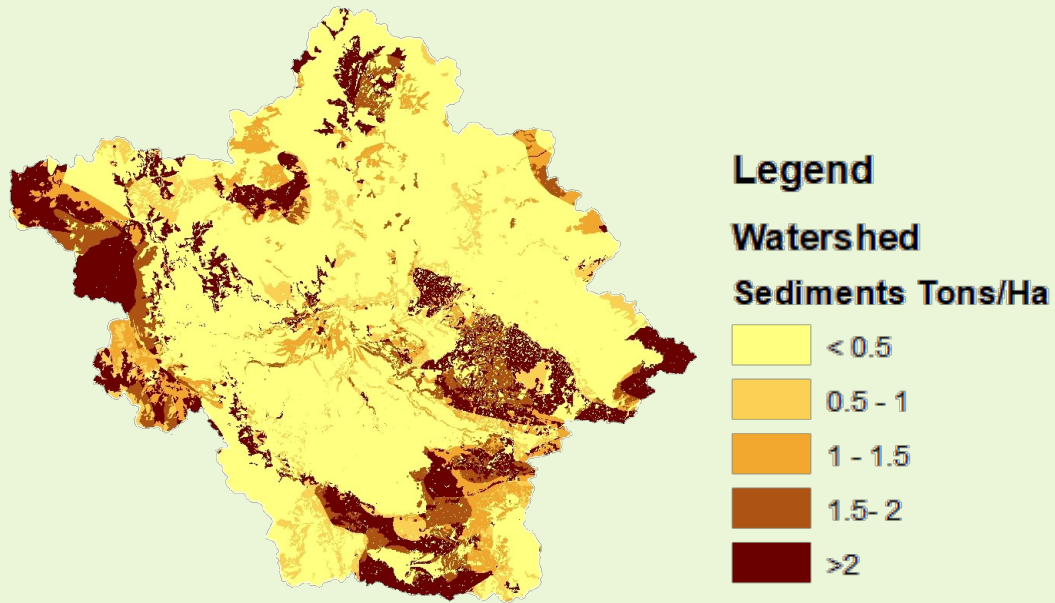

---

Calibration for N was carried out :

- At 2 sites (Tempi and Amigdalia)
- Evaluation of the results using statistical indexes

Sediment distribution

Slope map

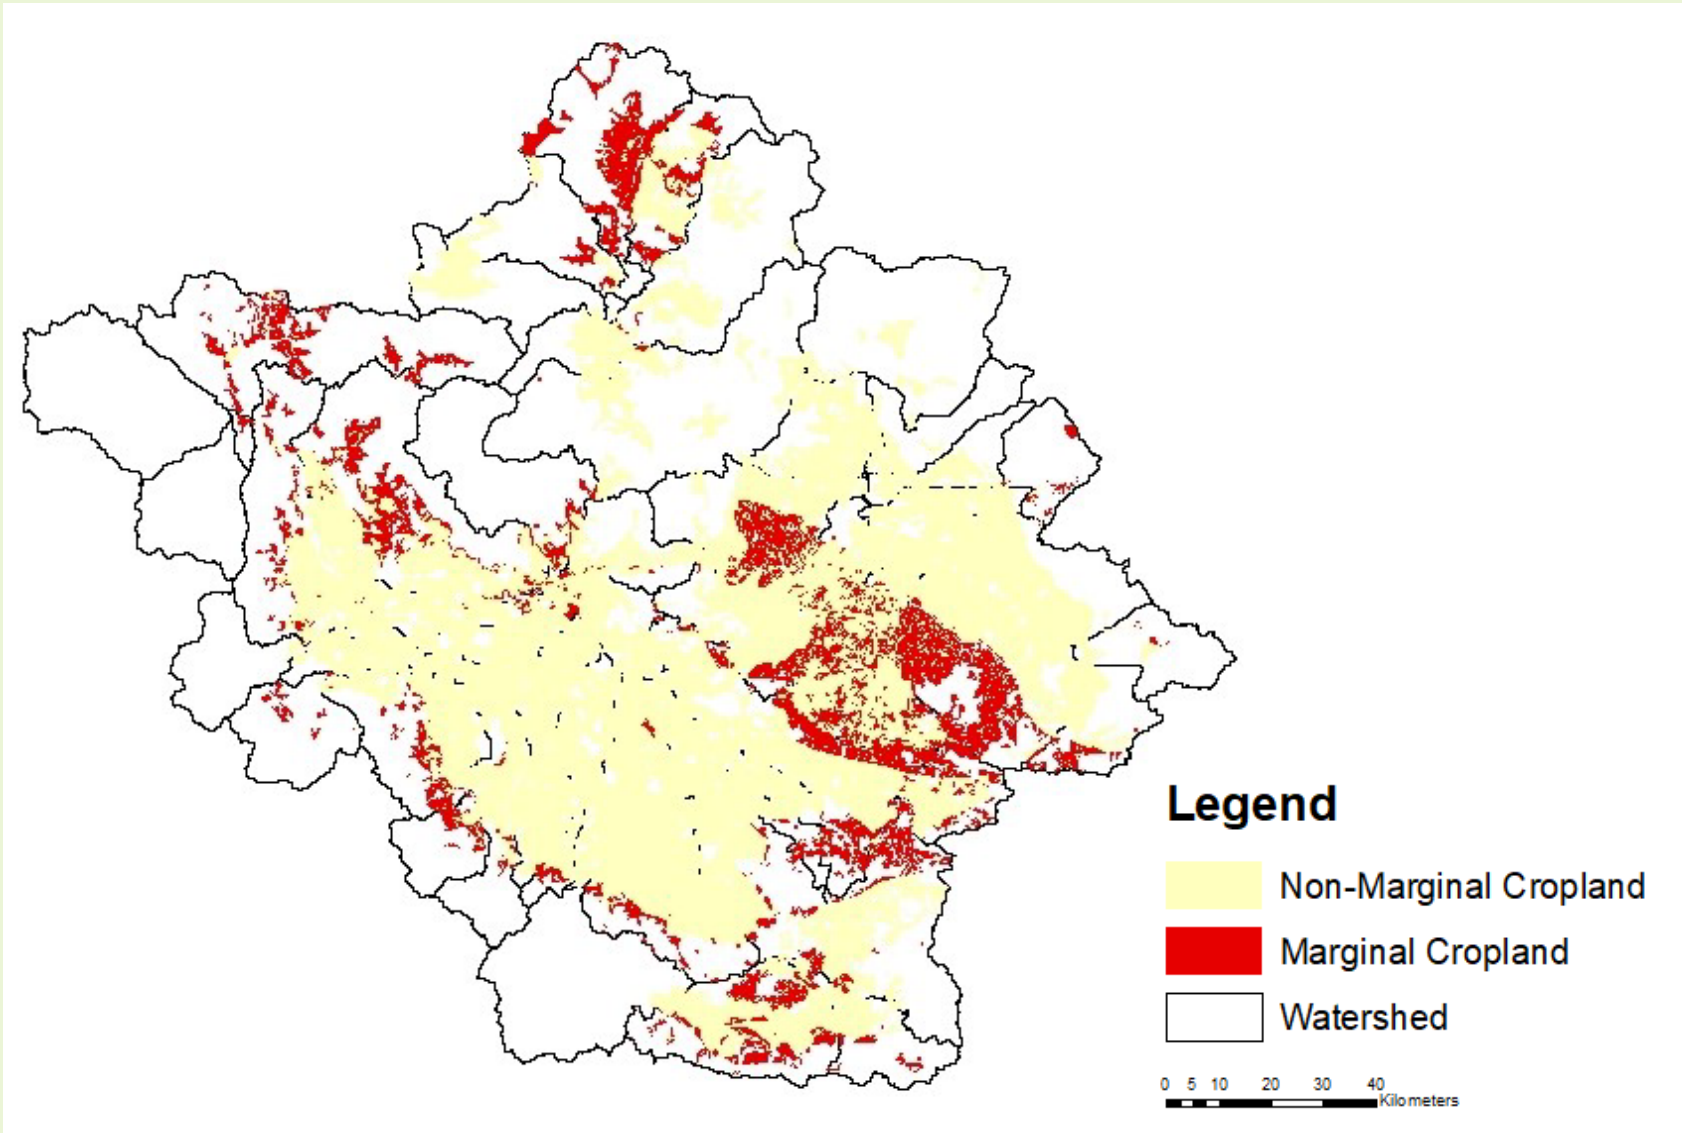

## Marginal cropland

Marginal selection criteria

- Slope class >2%
- Sediments > 2 tons/Ha (baseline)
- Agricultural use (Panagopoulos et al, 2017)

# Marginal cropland

# Preliminary results<sup>(10)</sup>

### Cotton production (kg/Ha)

### Durum wheat production (kg/Ha)

### Corn production (kg/Ha)

### Alfaalfa production (kg/Ha)

# Conclusions

- ❑ Switchgrass is very effective in reducing N water pollution and sediments
- ❑ The 80% and 100% implementation scenarios are not realistic
- ❑ The 20% Switchgrass implementation scenario is the ideal one for the study area
- ❑ SWAT switchgrass yields underestimated

# Further research

---

- Improve SWAT modeling for bioenergy crops
- Crop yields and biomass need calibration
- Progressively add more areas for switchgrass implementation based on economic factors
- Optimization to determine the optimal scenario for the study area

---

Thank you for your attention
